## 1. Overview

This guide will attempt to show users how to set up two Ubiquiti pieces of equipment, to provide for a secure and flexible firewall / router and a Wi-Fi Access Point. The two pieces of equipment used in this guide are:

- Ubiquiti EdgeRouter ER-X (about \$60 when this guide was written)
- Ubiquiti AP-AC-LR Wi-Fi Access Point (about \$100 when this guide was written).

This equipment can provide (at least) 3 isolated or semi-isolated wired networks, and up to 4 isolated or semi-isolated Wi-Fi SSIDs. The networks provided by this equipment configuration of this guide are as follows:

- Wired/Wifi Home Network For most of the household personal computers, tablets, and smartphones
- Wired Separate Network For an isolated and/or separate network and/or personal computer(s)
- Wired/Wifi IOT Network For Internet-Of-Things devices (can be accessed via Home Network)
- Wi-Fi Guest Network For visiting friends' tablets and smartphones

Your network naming and use may / can be different. A fourth Wifi "Spare" Network is also available.  
See Figure 1 - Overview Diagram.

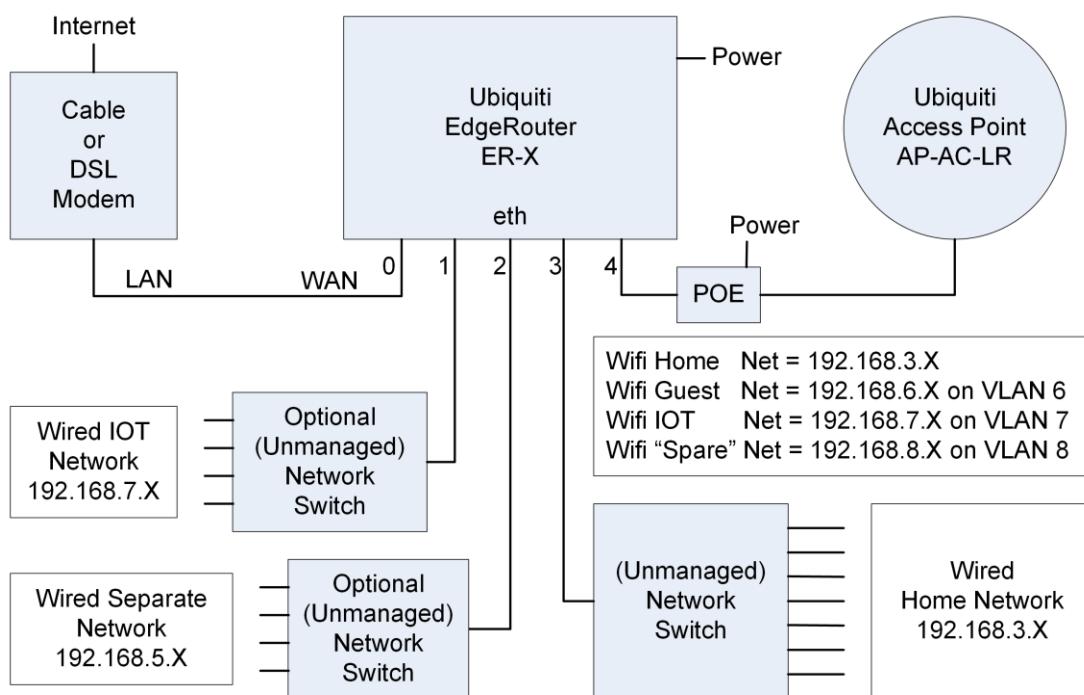

Figure 1 - Overview Diagram

With this setup, the Home Network (both Wired and Wi-Fi) is able to initiate connections / communicate with devices on the Wired/ WiFi IOT Network. Devices on the IOT Networks are NOT able to initiate connections / independently communicate to the Home Network. None of these Networks can communicate with the Wired Separate Network, and the Wired Separate Network cannot communicate with any of them.

This guide assumes that you will be using both an Ubiquiti EdgeRouter ER-X and some model of Ubiquiti Access Point (UAP). I tend to use the terms ER-X and EdgeRouter somewhat interchangeable within this guide.

Ubiquiti ER-X Product Links:

<https://www.ui.com/edgemax/edgerouter-x/>

<https://store.ui.com/collections/operator-edgemax-routers/products/edgerouter-x>

Ubiquiti AP-AC-LR Product Links (many other models available):

<https://www.ui.com/unifi/unifi-ap-ac-lr/>

<https://store.ui.com/collections/unifi-network-access-points/products/unifi-ac-lr>

---

## 2. Disclaimer

This is a guide, your results may vary. I am not a network engineer. Enough said.

---

## 3. Purpose

One purpose of this guide is to provide a stable and usable router / firewall / access point configuration. This specific implementation is aimed at the Home / SOHO user.

Another purpose is to provide background on what these configuration settings accomplish, so that the reader can understand why these settings were chosen.

I wrote this guide because I REALLY like this router.

I was mostly motivated to switch routers by reading <http://routersecurity.org/> and <http://routersecurity.org/bugs.php>. This website should scare just about anybody that is currently using consumer / commercial routers. I'm so glad to be finished with that buggy equipment.

The only trouble with this router is that it is meant for professionals to use. You have to scrounge around forums for postings on how to configure specific items. This doesn't mean that the forum people are not friendly, just that the needed answers are not all in one place. Sometimes the answers are a little bit terse for a new user. As stated, I am not a network engineer.

This guide is the documentation, for the configuration that I setup for myself. It took me a huge amount of time to put this document together. I've tried to write this guide in a teaching manner, and cite references where I could. Note that I specifically call this a 'guide'. When you go through this document you should: experiment, modify, learn, tinker and play, extend, and learn some more. Mix and match the sections as you see fit.

Most of my source information came from reading postings at (the now revamped) EdgeMax Ubiquiti Community:  
(Formerly) <https://community.ubnt.com/t5/EdgeMAX/bd-p/EdgeMAX>  
(Currently) <https://community.ui.com/tags/edgemax/questions?>

When this document was ready, I joined the Ubiquiti community and announced it at (formerly / currently):  
<https://community.ubnt.com/t5/EdgeMAX/New-ERX-AC-AP-LR-setup-guide-for-beginners/td-p/1906477>

<https://community.ui.com/questions/New-ERX-AC-APLR-setup-guide-for-beginners-/700af0ae-35d5-41ac-af80-f50963c8dad3>

If you have specific questions about this configuration, your best bet is to research postings at the above EdgeMax link, then try and experiment for yourself. If you get stuck, then join the Ubiquiti community and ask. I've now purchased an additional ER-X router to continue experimenting and for use in refining this guide.

Note that the associated backup file(s) on github are not being actively maintained or updated with later changes being made in this guide. These are there as references.

---

## 4. Alternate / Similar Ubiquiti Equipment

**1)** There are now alternate “nicely priced” EdgeRouters available. I have no experience with any of these EdgeRouters.

<https://www.ui.com/edgemax/comparison/>

EdgeRouter -10X:

<https://store.ui.com/products/edgerouter-10x>

<https://community.ubnt.com/t5/EdgeRouter/Anyone-want-to-share-their-experience-with-ER-10X/m-p/2765723#M250254>

EdgeRouter-12:

<https://store.ui.com/collections/routing-switching/products/edgerouter-12>

<https://community.ubnt.com/t5/EdgeRouter/New-ER-12-owner-ER-12-Questions/m-p/2768623#M250484>

If you were to try to configure one of these alternate routers using this guide, you would have more ports available, and would need to adjust port number and port ranges as needed. You would need to follow the *concepts* of this guide, adjusting / modifying as you go for your specific equipment.

**2)** There are many models of Ubiquiti Access Points which can work well.

<https://help.ui.com/hc/en-us/articles/360008036574-UniFi-Access-Point-Comparison-Charts>

<https://help.ui.com/hc/en-us/articles/115005212927-UniFi-UAP-Antenna-Radiation-Patterns>

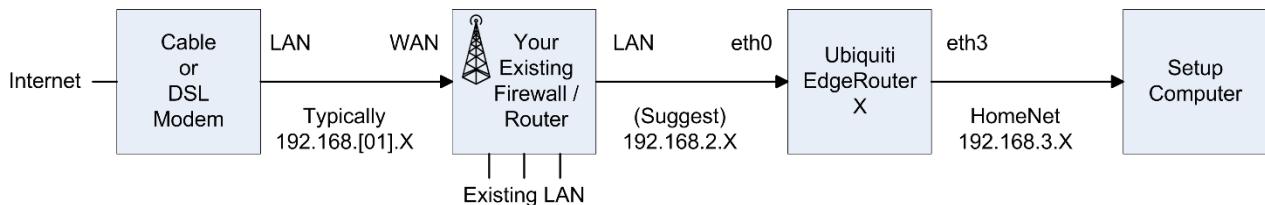

I chose the AP-AC-LR, because it seemed to provide the best coverage area, at the almost lowest price. More expensive models can handle several 100's of connections per AP. My home is not that crowded.

You probably don't want to purchase a generation 1 product per

<https://help.ui.com/hc/en-us/articles/360012192813#unifi-gen>

## 5. EdgeRouter IP Address Use

For the purposes of this guide, I am assuming that you will put your Ubiquiti EdgeRouter in series with your existing firewall / router, after the EdgeRouter has been initially configured. This way, you can leave your existing network alone, while securely setting up and testing your EdgeRouter. You need to ensure that your existing network does not use any of the following network addresses: 192.168.3.X, 192.168.4.X, 192.168.5.X, 192.168.6.X, or 192.168.7.X, or 192.168.8.X, as these address ranges will be used within the EdgeRouter. I suggest that you set up or re-configure your existing router to use IP addresses of 192.168.2.X on its LAN ports. Existing router addresses of 192.168.0.X or 192.168.1.X will also work. Your existing equipment may have the “Cable or DSL Modem” portion and “Your Existing Firewall / Router” portion combined into one single unit. See Figure 2 - EdgeRouter Configuration Setup. You will also need a computer to setup the EdgeRouter.

**Figure 2 - EdgeRouter Configuration Setup**

Most cable / DSL modems seem to be pre-configured for DHCP, and for using addresses of 192.168.0.X or 192.168.1.X on their LAN ports. Therefore, I configured the EdgeRouter Network addresses not to include those ranges. I deliberately left the address range of 192.168.2.X unused within the EdgeRouter, so those addresses could be used by an existing firewall / router's LAN ports.

If the EdgeRouter was using an address that was also used by your Cable / DSL modem, it would mask / hide that equipment's setup web page(s), and you would not be able to access those pages.

The EdgeRouter will NOT work if the address presented via DHCP to its eth0 port maps anywhere within one of the address ranges used internally by the EdgeRouter.

If your Internet Service Provider's (ISP) equipment does not provide an IP address via DHCP, then you will need to adjust your WAN (eth0) settings after running the setup wizard. If the internet is only partially working, or you need to use PPPoE, then you might want to read:

<https://community.ubnt.com/t5/EdgeRouter/Adjust-the-MSS-value-for-the-PPPOE/td-p/2617231>

[https://community.ubnt.com/t5/EdgeMAX/Can't-open-some-webpages/m-p/1950743/highlight>true#M163311](https://community.ubnt.com/t5/EdgeMAX/Can-t-open-some-webpages/m-p/1950743/highlight>true#M163311)

<https://samuel.kadolph.com/2015/02/mtu-and-tcp-mss-when-using-pppoe-2/>

<https://community.ui.com/questions/Google-Fiber-Speed-Issues-with-EdgeRouter/bd3e9acb-fa4c-4711-9a7f-9f1d66d5578c>

---

## 6. Acquire EdgeRouter Documentation

On the computer you use to setup the EdgeRouter X, download the newest documentation from:

<https://www.ui.com/download/edgemax/edgerouter-x/er-x>

There are both a User's Guide and a Quick Start Guide.

Note that Ubiquiti makes several models of EdgeRouter equipment. Each model uses different hardware, has different capabilities, supports a different number of ports, and may be configured (sometimes subtly) differently from each other. For instance, the EdgeRouter Lite typically uses eth1 as its WAN port, while the EdgeRouter X typically uses eth0 as its WAN port. Watch out for these types of differences when doing internet searches. EdgeMAX is the operating system for the EdgeRouter series.

---

Ben Pin (Ubiquiti Employee) has a bunch of tutorial videos:

<https://www.youtube.com/channel/UC9jUG4FPm9mPM555WOKSl6g>

## 8. Initial EdgeRouter Hardware Setup

Configure the setup computer's Ethernet jack as having a fixed IP address of 192.168.1.X (where X is 2 to 254), and a netmask of 255.255.255.0. There are many tutorials available on the internet that shows how to configure a computer's Ethernet port to use a fixed IP address. One way to configure a Windows 10 computer is:

Control Panel -> Network & Internet -> Ethernet -> Change Adapter Settings -> Internet Protocol Version 4  
-> Properties -> Use the following IP address.

See Figure 3 – Windows 10 Ethernet Address Setup.

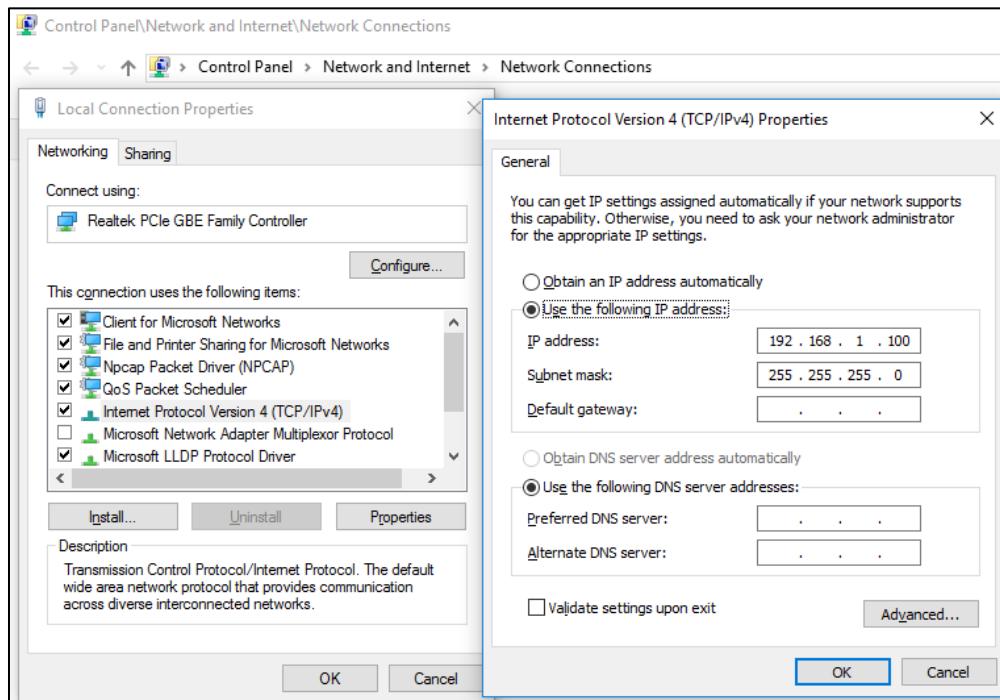

Figure 3 – Windows 10 Ethernet Address Setup

Power up your EdgeRouter X using the supplied power adapter, and then depress and hold the reset button for about 15 seconds. After releasing the reset button, connect a standard Ethernet cable from the EdgeRouter's eth0 port to the setup computer's Ethernet jack. See Figure 4 – Initial EdgeRouter Hardware Setup.

Note that some setup computers may have an additional Ethernet adapter or have an additional Wi-Fi adapter installed. If any additional adapter(s) are installed, and an adapter is using or connecting to an address within the range of 192.168.1.X, then you will need to temporarily disable that additional adapter. The additional adapter only needs to be disabled while you are trying to access the EdgeRouter at its initial hardware setup address of 192.168.1.1.

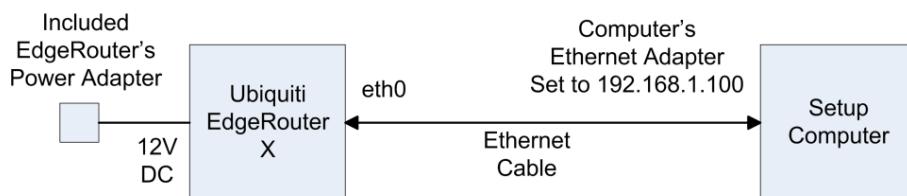

Figure 4 – Initial EdgeRouter Hardware Setup

Reference Quick Start Guide and the User's Guide @Chapter 2:Using EdgeOS.

## 9. Initial EdgeRouter Login

Wait about three minutes for the EdgeRouter to boot up, then open a web browser of your choice on your setup computer and enter <https://192.168.1.1> into the address field.

Note that there are UI community discussions about the EdgeRouter's web page not working correctly with Apple's Safari browser and/or not working correctly with Apple's iPad. I can confirm that my iPad will not show a correct page. One hint of an incorrect page is that "TBD" shows up under the "IP Addr" field on the Dashboard page and lots of items at the top of the page are blank / black.

The browser may issue a security warning. You will need to "Continue to this web site" or equivalent. The exact prompts and responses vary by browser. See Figure 5 – IE Security Certificate Example.

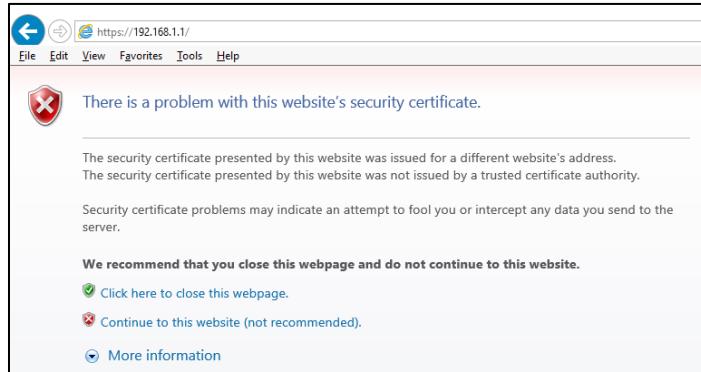

Figure 5 – IE Security Certificate Example

You will likely see a combined login and license agreement dialog. Enter the username and password. The default username is "ubnt" and the default password is "ubnt". Do what you need to do for the agreement. See Figure 6 – Ubiquiti License Agreement Dialog.

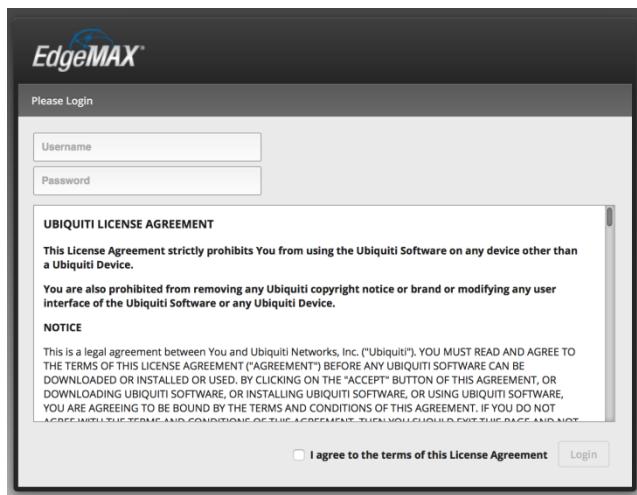

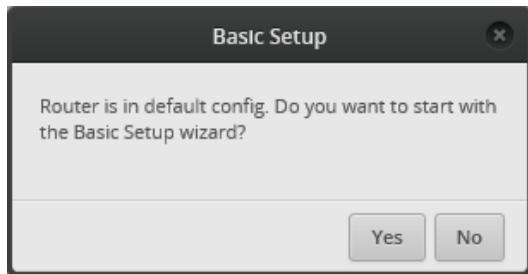

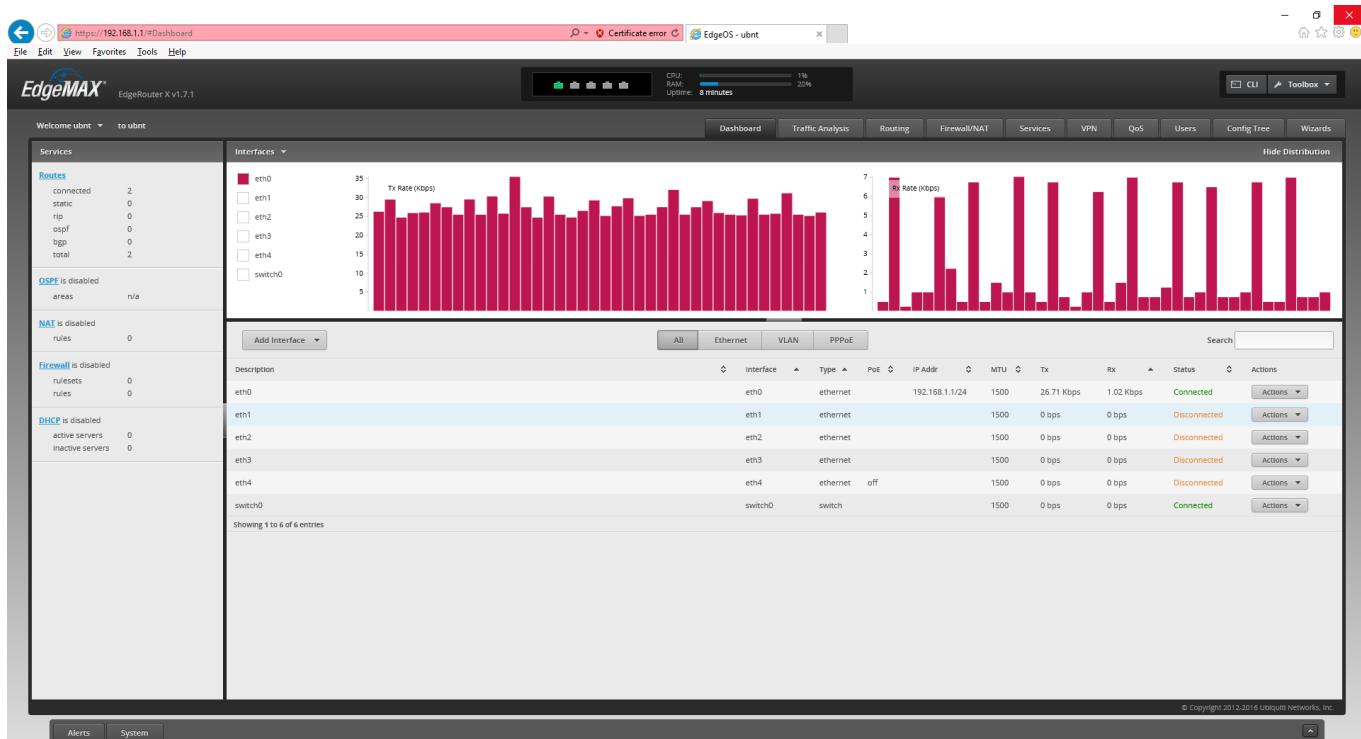

Figure 6 – Ubiquiti License Agreement Dialog

Depending upon the version of firmware that was pre-installed on your EdgeRouter, you may be presented with a dialog box stating that the “Router is in default config. Do you want to start with the Basic Setup wizard?” If presented, answer No. See Figure 7 – Basic Setup Question.

**Figure 7 – Basic Setup Question**

You will land on the Dashboard screen. See Figure 8 – Initial Dashboard Screen.

**Figure 8 – Initial Dashboard Screen**

Reference Quick Start Guide and the User’s Guide @Chapter 2:Using EdgeOS.

---

## 10. Update EdgeRouter (System) Firmware

WARNING: As of early 2020, many forum users are reporting that newer versions of Google's Chrome browser may no-longer work for uploading / downloading system images and/or configuration files. Try to use a FireFox browser. Reference <https://community.ui.com/questions/Has-Chrome-83-broken-restoring-configuration-backups/c6a2d0e6-5f0d-494e-b588-c477cf5e19e4>

Note: Sometimes to download newer system firmware, you might need to first recover more space on your ER-X router. You can issue the CLI command:

```
delete system image
```

to recover more space. Note that this deletes the backup (configuration) image, not the running (configuration) image. Only do this command if you cannot otherwise update. Reference Section 15 - EdgeRouter Command Line Interface (CLI).

On your setup computer, download the NEWEST firmware from:

<https://www.ubnt.com/download/edgemax/edgerouter-x/er-x>

Newest Note: As of Late 2019, Ubiquiti has maintained two sets / lines of system firmware for the ER-X model. Specific release numbers, below, are as of June 2020:

Firmware v1.10.11

Firmware v2.0.8-hotfix.1

The v1.10.x line is highly regarded, and universally seen as stable, but Ubiquiti has stated that there will be no more updates made to the v1.10 series. What a shame.

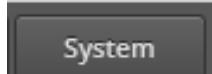

The v2.0.x line of releases has been a disaster, especially for the ER-X model. Ubiquiti has released firmware which is not even of alpha quality, hardly tested it, and then released it into the stable channel. They have done this again and again and again. I strongly suggest NEVER loading any v2.0 release before v2.0.8-hotfix.1. As of June 2020, I am still running V1.10.11.

For reference, during the initial writing of this document, the firmware was at:

“EdgeRouter ER-X/ER-X-SFP/EP-R6: Firmware v1.9.1”.

Some of the ER-X screenshots in this guide have now been taken over many different firmware versions..

Press the “System” button. See Figure 9 – System Button. This button is located near the lower-left corner of the dashboard screen, as shown in Figure 8 – Initial Dashboard Screen.

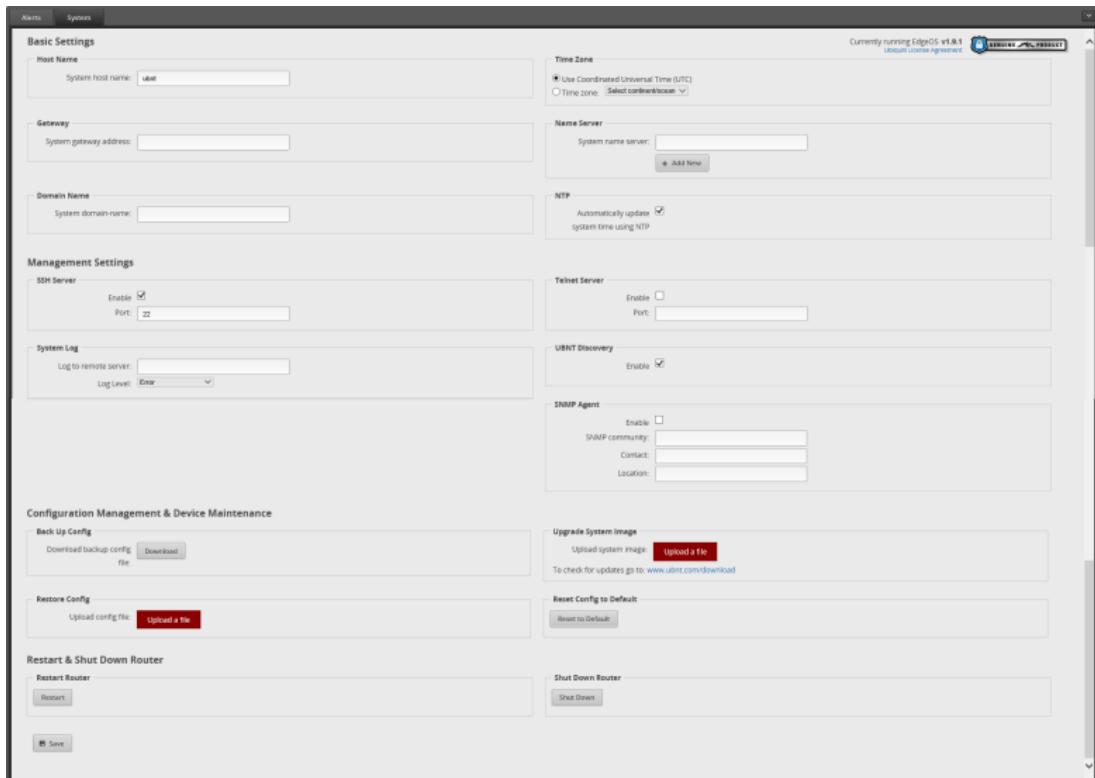

**Figure 9 – System Button**

Sometimes the System button and/or the Alerts button, which is right next to the System button, don't seem to work for me. I usually just click the other button twice, and then click the button I want.

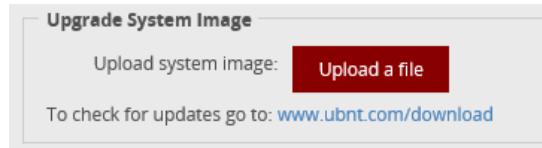

You might want to join the Ubiquiti community and sign up for notifications about new software / firmware updates. You could also just periodically poll the above link, looking for new updates. It is probably a good idea to keep (somewhat) up to date firmware on your EdgeRouter, for security updates.

The System window will then pop-up an overlay that will cover most of your screen. See Figure 10 – System Pop-up Screen.

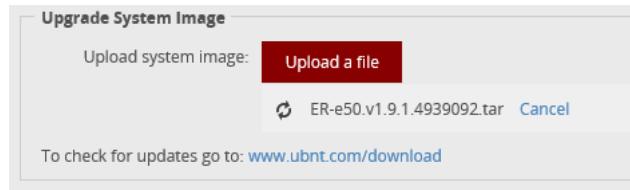

**Figure 10 – System Pop-up Screen**

Find the “Upgrade System Image” section, and press the “Upload a file” button. See Figure 11 – Upgrade System Image.

**Figure 11 – Upgrade System Image**

Choose the firmware file that you downloaded earlier. The EdgeRouter will then install the chosen file. See Figure 12 – Upload a file.

**Figure 12 – Upload a file**

You will eventually be asked if you want to reboot the EdgeRouter. Press the “Reboot” button. You will then be asked to confirm the reboot, click on the “Yes, I’m sure” button. See Figure 13 – Upgrade Complete Dialog.

The router will inform you that it is rebooting. See Figure 14 – Reboot Process.

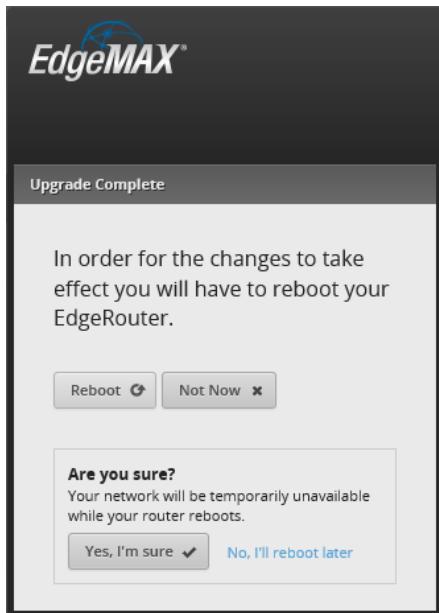

Figure 13 – Upgrade Complete Dialog

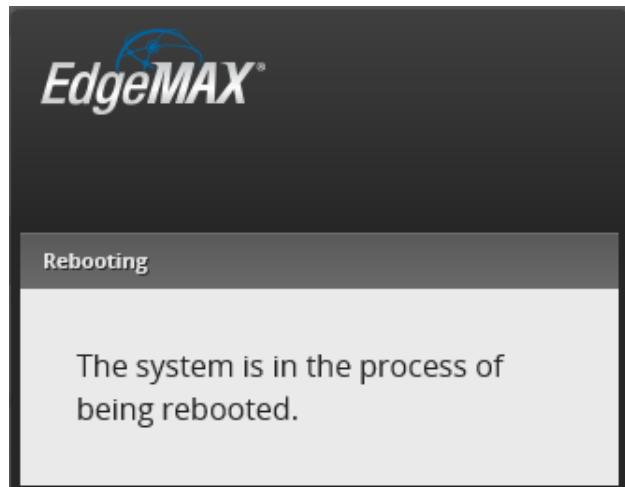

Figure 14 – Reboot Process

While the EdgeRouter is rebooting, the web page will present you with a Lost Connection Dialog. See Figure 15 – Lost Connection Dialog.

Eventually, when the EdgeRouter has fully re-booted, the presented dialog will change to Figure 16 – Timed-Out Dialog. This is a nice touch of web programming from Ubiquiti, so you can easily know when re-booting has completed.

Press the Reload button.

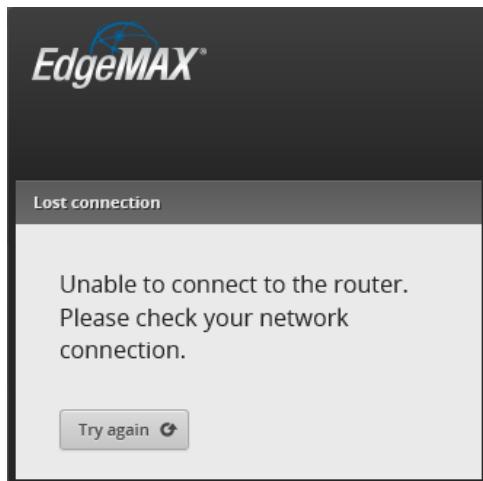

Figure 15 – Lost Connection Dialog

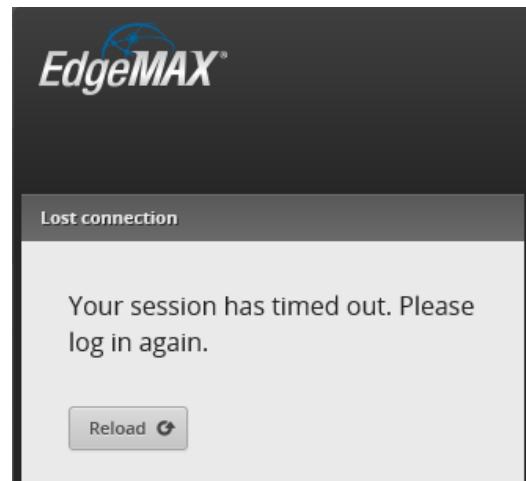

Figure 16 – Timed-Out Dialog

You will be asked to login; please enter the username and password into the dialog. The default username is “ubnt” and the default password is “ubnt”. See Figure 17 – Login Dialog.

**Figure 17 – Login Dialog**

You should be presented with a dialog box stating that the “Router is in default config. Do you want to start with the Basic Setup wizard?” Answer “no.” Reference Figure 7 – Basic Setup Question.

You will (again) land at the Dashboard screen. Reference Figure 8 – Initial Dashboard Screen. Check the upper left of the screen and verify that you are presented with the version of code that you just downloaded. See Figure 18 – Example EdgeRouter Version.

**Figure 18 – Example EdgeRouter Version**

---

## 11. About Using Two or More Ubiquiti Access Points

Some people have wanted to connect two (or more) Ubiquiti Access Points (UAPs) to their ER-X to provide more / wider WiFi coverage. The following ideas should work, but I have only tested Methods 1 and 4. Therefore, the following directions are approximate.

**Method 1:** Connect an 802.1Q capable switch to eth4, and then connect your access points to this switch. Some switches will need to be specifically configured to pass VLAN 6,7,8 data. The HomeNet / trunk / 192.168.3.X data will probably not need to be specifically configured.

Netgear and TP-Link make some inexpensive switches which should work. Some models are:

Netgear: GS105Ev2 (5 port) and GS108Tv2 (8 port)

TP-Link: TL-SG105E (5 port) and TL-SG108E (8 port)

TP-Link: TL-SG105 Ver 2.1 (5 port) UN-managed switch

Note that these managed switches are typically configured via a Microsoft Windows (only) program. Some of these switches now have an embedded web server in them for configuration. These web servers may be incomplete in implementing the needed configuration commands. I have now tested Method 1 with a TP-LINK TL-SG105EV2 managed switch and separately tested with a TL-SG105 Ver 2.1 Un-managed switch. I believe you will need a hardware version of V2 or above to operate correctly. For configuration details, reference Appendix A. I suggest that you don't perform these operations until you are finished with the rest of this document.

**Method 2:** Plug your one or two additional UAP(s) directly into the ER-X router. You will need to forego the Wired IOT Network and/or the Wired Separate Network, unless you happen to have zero wired devices on the HomeNetwork. This would alternately configure the HomeNet on ports 1,3,4 or 2,3,4 or 1,2,3,4. This saves the cost of needing to purchase an additional 802.1Q capable switch, but delivers fewer features.

To include port 1 in HomeNet, instead CHECK the "One LAN" box in section 12 / Figure 21. You will need to figure out the additional associated changes which are later in this document.

To include port 2 in HomeNet, DON'T follow sections 19, 20, 26. You will need to figure out the additional associated changes which are later in this document.

**Method 3:** Use an ER-X SFP instead of a "plain" ER-X. This model router has an extra SFP port on it. You will also need an appropriate SFP adapter to use the extra port. Using this Method, just about doubles the cost of this project. I hear that most "copper" SFP modules do not auto-negotiate link speeds.

**Method 4:** Configure the additional Ubiquiti access points to WiFi mesh / chain to the original UAP.  
[Update: it appears that multi-hop support has been added in later versions of AP firmware.]

Reference the following:

<https://help.ubnt.com/hc/en-us/articles/115002262328-UniFi-UAP-Configuring-Wireless-Uplink>

Ubiquiti also makes specific equipment for multi-hop deployments. Some of that equipment is rated for outdoor use. Note that using mesh equipment / modes will likely decrease your wireless bandwidth by at-least half. If you can, wire each Access Point back to your EdgeRouter.

**General:**

Except for method 4, Each UAP should be Ethernet-wired and they should all be configured the same, except that each UAP should be configured using different and non-overlapping WiFi channels. For the U.S., the non-overlapping 2.4GHz channels are: 1, 6, and 11.

I would look at <https://community.ubnt.com/t5/UniFi-Wireless/bd-p/UniFi> for more info on UAP setup.

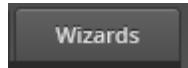

See also section 14, the “VLAN References” portion of section 29, and more information in Appendix A.

Ethernet data can be sent over cable TV coax by using “Multimedia over Coax Alliance (MOCA)” adapters. These can be used for general purpose Ethernet drops or for wiring / placing UAPs within a house. These are discussed in Appendix B.

---

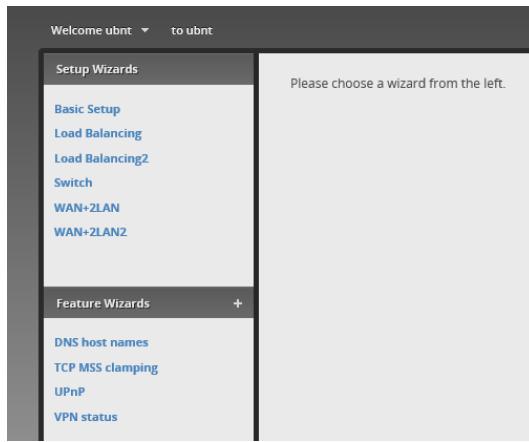

## 12. EdgeRouter Wizard

Press the “Wizards” button, which is located in the upper-right portion of the Dashboard screen. See Figure 19 – Wizards Button.

**Figure 19 – Wizards Button**

You will see the following (portion shown) of the Wizard Screen. See Figure 20 – Wizard Screen Portion.

**Figure 20 – Wizard Screen Portion**

Note that there are various Wizards available, which can turn the EdgeRouter into a network switch, or perform load balancing between two WAN interfaces. Most people will probably be interested in a “standard” setup, as described in this guide, which is “WAN+2LAN2”.

Choose “WAN+2LAN2”. See Figure 21 – Wan+2LAN2 Dialog. You will need to expand / open sections, and make the following selections:

In the “Internet Port” section:

Port:	eth0	
Internet CT:	DHCP	
VLAN:	UN-Checked	(Internet Connection is on VLAN)
Firewall:	CHECKED	(Enable the default firewall)
DHCv6 PD:	UN-Checked	(Enable DHCv6 Prefix Delegation)

In the next (unlabeled) section:

One LAN:	UN-Checked	(Only use one LAN)
----------	------------	--------------------

In the “(Optional) Secondary LAN port (eth1)” section:

Address:	192.168.4.1 / 255.255.255.0	
DHCP:	CHECKED	(Enable the DHCP server)

In the “LAN ports (eth2, eth3, eth4)” section:

Address:	192.168.3.1 / 255.255.255.0	
DHCP:	CHECKED	(Enable the DHCP server)

If your internet provider uses something other than DHCP (i.e. IP address provided from your cable / dsl modem), you will need to select “Static IP” or “PPPoE”, and then configure those settings accordingly.

Unchecking the “Only use one LAN” selection informs the Wizard to un-bundle eth1 from eth2-4, allowing for the provision of a separate Network. I used this eth1 Network for Wired IOT devices.

It is important that “Enable the default firewall” is CHECKED. The entire security of this router depends upon this setting.

Under the “User setup” section, either change the default password to something secure / unique or “Create new admin user” with a secure / unique password. If you “Create new admin user”, you will need to also return to this dialog and delete the default “ubnt” login. You will need to remember your login credentials.

[Note you **REALLY** should make a new and unique admin-user login-name and then delete the default ‘ubnt’ login-name for security.]

Press “Apply” at the bottom of the screen.

Use this wizard to set up basic Internet connectivity and to customize local network settings

**Internet port (eth0 or eth4)**

Connect eth0 or eth4 to your Internet connection, for example, the cable modem or DSL modem, and select the connection type.

Port	<input type="text" value="eth0"/>
Internet connection type	<input checked="" type="radio"/> DHCP <input type="radio"/> Automatically obtain network settings from the Internet Service Provider <input type="radio"/> Static IP <input type="radio"/> PPPoE
VLAN	<input type="checkbox"/> Internet connection is on VLAN
Firewall	<input checked="" type="checkbox"/> Enable the default firewall
DHCPv6 PD	<input type="checkbox"/> Enable DHCPv6 Prefix Delegation

One LAN  Only use one LAN

**(Optional) Secondary LAN port (eth1)**

Optionally, connect eth1 to your secondary local network.

Address	<input type="text" value="192.168.4.1"/> / <input type="text" value="255.255.255.0"/>
DHCP	<input checked="" type="checkbox"/> Enable the DHCP server

**LAN ports (eth2, eth3 and eth4)**

Connect the LAN ports to your devices or/and a switch that connects to additional devices.

Address	<input type="text" value="192.168.3.1"/> / <input type="text" value="255.255.255.0"/>
DHCP	<input checked="" type="checkbox"/> Enable the DHCP server

**User setup**

Setup user and password for the new router config.

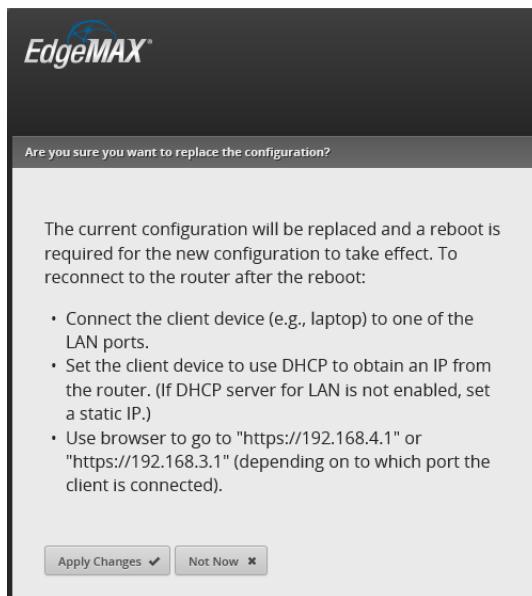

User  Use default user  
 Use default user and password for the router. Password could be customized optionally.

User	<input type="text" value="ubnt"/>
Password	<input type="password" value="*****"/>
Confirm Password	<input type="password" value="*****"/>

Create new admin user  
 Keep existing users

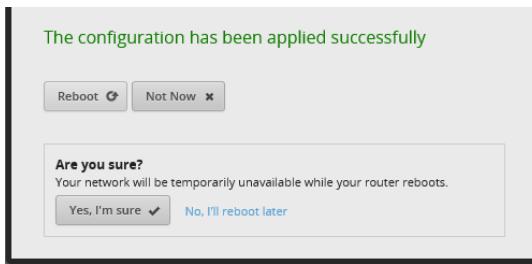

**Figure 21 – Wan+2LAN2 Dialog**

After Applying, you will be presented with Figure 22 – Replace Configuration. Please study what it says. Press “Apply Changes.”

**Figure 22 – Replace Configuration**

Press Reboot, then confirm the reboot, by pressing the “Yes, I’m sure” button. See Figure 23 – Reboot into New Configuration.

**Figure 23 – Reboot into New Configuration**

The EdgeRouter will inform you that it is rebooting. Reference Figure 14 – Reboot Process. The EdgeRouter takes several minutes to reboot.

Disconnect your setup computer’s Ethernet jack from the EdgeRouter’s eth0 connection. Re-configure your setup computer’s Ethernet port back to using DHCP. Again, there are many tutorials available on the internet that show how to configure a computer’s Ethernet jack to use DHCP. Reference section 8 - Initial EdgeRouter Hardware Setup, but instead choose “Obtain an IP address automatically.” Also reference Figure 3 – Windows 10 Ethernet Address Setup.

## 13. EdgeRouter Re-Connection

Ensure that your existing router's LAN ports are not using any of the addresses utilized by the EdgeRouter, i.e. not using 192.168.3.0 through 192.168.8.255. Reference section "5 - EdgeRouter IP Address Use." Connect the EdgeRouter's eth0 port into your existing router's LAN port with a standard Ethernet cable. Connect your setup computer's Ethernet port (now re-configured for DHCP) into the EdgeRouter's eth3 port. See Figure 2 - EdgeRouter Configuration Setup.

Open a web browser on your computer and enter <https://192.168.3.1> into the address field.

Acknowledge the browser's security warning, Reference Figure 5 – IE Security Certificate Example.

Login to your EdgeRouter, as shown in Figure 17 – Login Dialog.

You will be presented with the Dashboard Screen. See Figure 24 – Dashboard Screen.

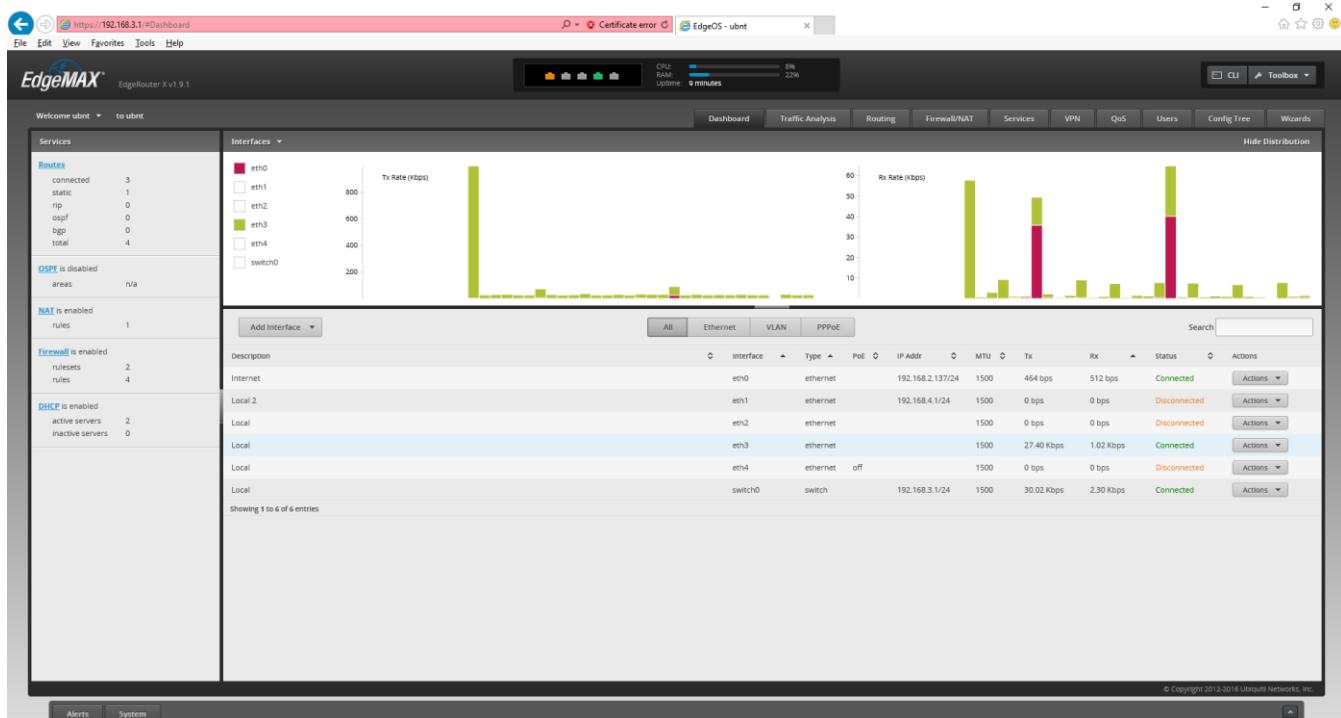

Figure 24 – Dashboard Screen

---

## 14. Network Naming

Setting up the EdgeRouter, per this guide, provides for several separate Networks. In this guide, I try to use the word “Network” (capitalized) for these. Each Network has a unique IP address range / subnet. See Table 1 - Table of Networks.

Network Name	IP Address Range	Interface	VLAN
Internet	DHCP	eth0	No
Home Network	192.168.3.X	eth3, eth4	No
Wired IOT Network	192.168.4.X	eth1	No
Wired Separate Network	192.168.5.X	eth2	No
Wi-Fi Guest Network	192.168.6.X	-	6
Wi-Fi IOT Network	192.168.7.X	-	7
Wi-Fi Spare Network	192.168.8.X	-	8

**Table 1 - Table of Networks**

Some of these Networks are on a Virtual LAN (VLAN). VLANs provide the ability for separate network data to be carried over shared Ethernet cables. Data that is “tagged” as belonging to a specific VLAN cannot interact with either non-VLAN data (trunk data) or with data from any different VLAN.

When VLANs are used, all devices involved with this data need to be VLAN aware. Any network switches carrying VLAN traffic will need to be IEEE 802.1Q capable, e.g. a Level 2 managed switch.

Note that the only VLAN traffic shown in Table 1 - Table of Networks is involved with the Wi-Fi Guest Wifi Iot, and Wifi Spare Networks. The Ubiquiti AP-AC-LR access point is VLAN aware. Eventually the Access Point will be plugged directly into the EdgeRouter’s eth4 interface, so VLAN data will be able to be carried between them. If you are going to deploy multiple Access Points, then the network switch attaching the Access Points to the EdgeRouter’s eth4 port MUST be IEEE 802.1Q capable.

This Wi-Fi VLAN data does NOT need to flow to devices on the Wired Home Network, therefore, the network switch attached to the EdgeRouter’s eth3 interface can be a (inexpensive) unmanaged switch. Reference Figure 1 - Overview Diagram. If they are needed, the network switches attached to the EdgeRouter’s eth1 and/or eth2 interfaces can also be (inexpensive) unmanaged switches.

Each Network is also customizable to provide functionality and connectivity. The rest of this guide will provide sufficient details on that.

There are many VLAN references on the web. Here is one brief tutorial:

<http://www.microhowto.info/tutorials/802.1q.html>

More References:

<https://help.ubnt.com/hc/en-us/articles/204976664-EdgeRouter-Packets-Processing>

I was asked to add a reference for google config to this guide, so here it is:

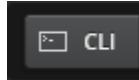

<https://github.com/mjp66/Ubiquiti/issues/31>

---

## 15. EdgeRouter Command Line Interface (CLI)

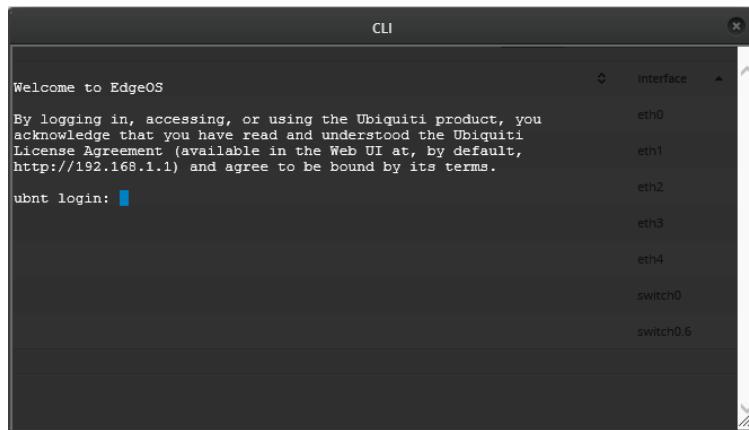

In most of Ubiquiti's Edgerouter forum posts, steps to (re-)configure items are given as Command line Interface (CLI) commands. In fact, not very many GUI screenshots are used, and they are typically posted only by novices.

The following steps show how to open and use the built-in CLI interface. Click on the “CLI” button, in the upper-right screen. See Figure 25 – CLI Button.

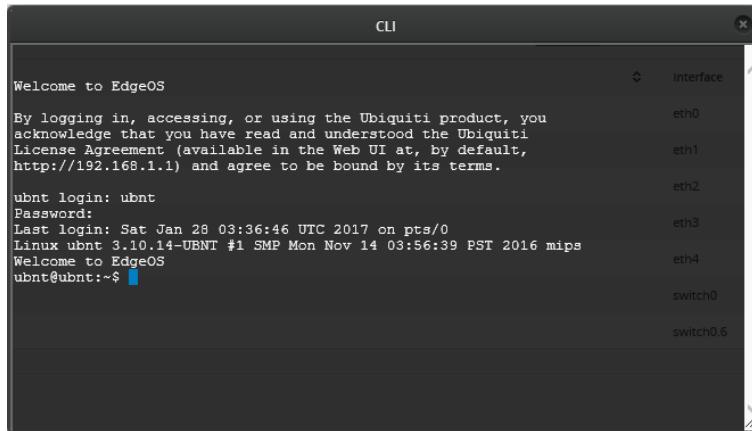

**Figure 25 – CLI Button**

The initial CLI window will appear as a semi-transparent overlay. See Figure 26 – Initial CLI Window.

**Figure 26 – Initial CLI Window**

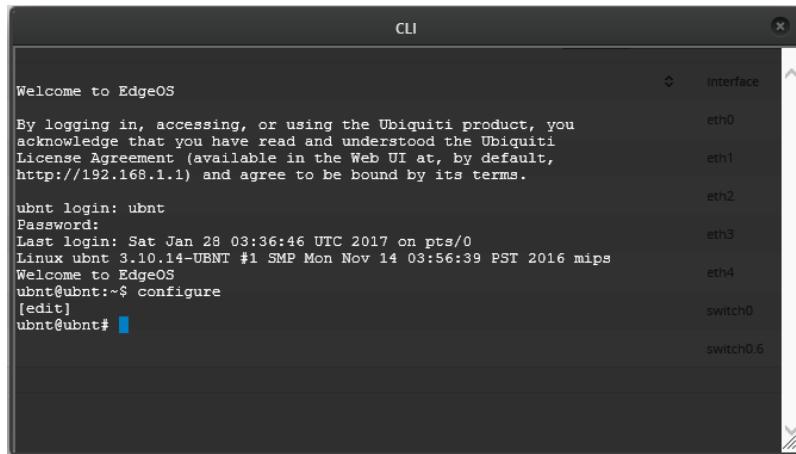

Login to this window, using your EdgeRouter’s user name and password. You will now be presented with a command prompt. See Figure 27 – Logged-In CLI Window.

**Figure 27 – Logged-In CLI Window**

CLI commands are typically divided into configuration commands and non-configuration commands. The CLI interface will accept only configuration commands when in configuration mode. Type the “configuration” command to enter configuration mode. The “exit” command is used to leave configuration mode and return to normal (non-configuration) mode.

If you enter the “configure” command, the CLI window’s prompt will now include “[edit]”, and the prompt will change to '#'. See Figure 28 – Configure CLI Window.

The screenshot shows a terminal window titled "CLI". It displays the following text:

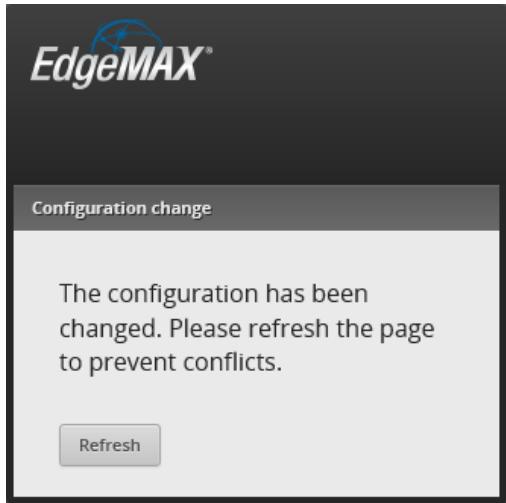

```
Welcome to EdgeOS
By logging in, accessing, or using the Ubiquiti product, you
acknowledge that you have read and understood the Ubiquiti
License Agreement (available in the Web UI at, by default,
http://192.168.1.1) and agree to be bound by its terms.

ubnt login: ubnt
Password:
Last login: Sat Jan 28 03:36:46 UTC 2017 on pts/0
Linux ubnt 3.10.14-UBNT #1 SMP Mon Nov 14 03:56:39 PST 2016 mips
Welcome to EdgeOS
ubnt@ubnt:~$ configure
[edit]
ubnt@ubnt#
```

To the right of the terminal, there is a vertical list of network interfaces labeled "Interface": eth0, eth1, eth2, eth3, eth4, switch0, and switch0.6.

**Figure 28 – Configure CLI Window**

Many times when doing a commit and/or a save command, the page will need to be refreshed. A refresh dialog box will pop-up on the screen. See Figure 29 – Configuration Change. Press the “Refresh” button.

**Figure 29 – Configuration Change**

You can also use a popular Windows program, called putty.exe, to Secure Shell (SSH) into the EdgeRouter, and then issue CLI commands. Unlike the CLI interface, Putty has the ability to do Copy / Paste. Linux users should already be familiar with how to use SSH. There is also a Windows specific program WinSCP, which is similar to SSH, but easily transfer files between a Windows PC and the EdgeRouter.

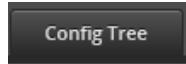

Here are some CLI references:

- <https://help.ui.com/hc/en-us/articles/204960094-EdgeRouter-Configuration-and-Operational-Mode>
- [https://dl.ubnt.com/guides/edgemax/EdgeSwitch\\_CLI\\_Command\\_Reference\\_UG.pdf](https://dl.ubnt.com/guides/edgemax/EdgeSwitch_CLI_Command_Reference_UG.pdf)
- <https://community.ubnt.com/t5/EdgeMAX/EdgeOS-CLI-Primer-part-1/td-p/285388>
- [https://community.ubnt.com/t5/EdgeMAX-CLI-Basics-Knowledge/tkb-p/CLI\\_Basics@tkb](https://community.ubnt.com/t5/EdgeMAX-CLI-Basics-Knowledge/tkb-p/CLI_Basics@tkb)

---

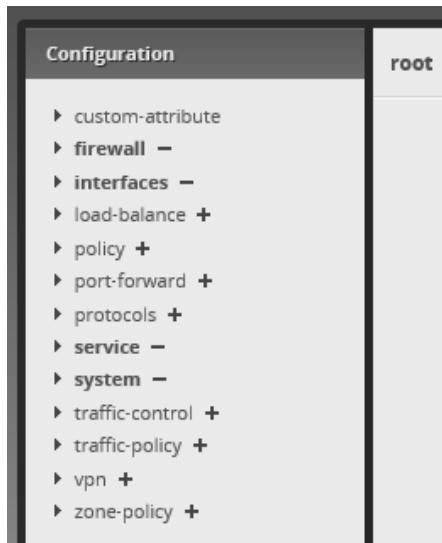

## 16. EdgeRouter Config Tree

There is a neat and alternate way to configure the EdgeRouter. Near the top of the screen is a “Config Tree” button. See Figure 30 – Config Tree Button.

**Figure 30 – Config Tree Button**

When you press it, the “Configuration” Tree window will appear. See Figure 31 – Config Tree Initial Screen.

**Figure 31 – Config Tree Initial Screen**

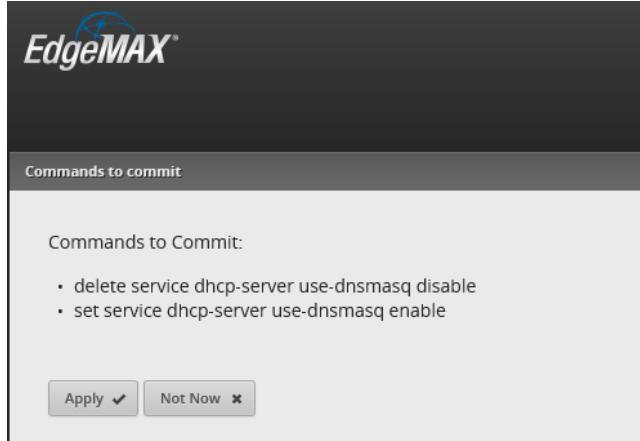

Using the config tree is an alternate method (for some items) to using the Command Line Interface (CLI).

---

## 17. My Command Line Trouble

When I was experimenting with dnsmasq, many internet resources simply gave CLI commands to enable this feature. When I tried some of these commands, my EdgeRouter had problems. I no longer remember what the exact problem was, but I noticed that sometimes when using the Config Tree, multiple commands were issued.

See Figure 32 – Example of Multiple Config Tree Commands.

**Figure 32 – Example of Multiple Config Tree Commands**

## 18. EdgeRouter Backup / Restore Configuration Files

WARNING: As of early 2020, many forum users are reporting that newer versions of Google's Chrome browser may no-longer work for uploading / downloading system images and/or configuration files. Try to use a FireFox browser. Reference <https://community.ui.com/questions/Has-Chrome-83-broken-restoring-configuration-backups/c6a2d0e6-5f0d-494e-b588-c477cf5e19e4>

When EdgeRouters are described in most internet forums, their configuration parameters are usually described (in text) by a standard file format. Eventually, you will need to be fluent in reading these files and translating that data into actions taken in the Command Line Interface (CLI), the Config Tree or the GUI.

You can find this configuration data within the config.boot file that is inside of the backup file generated from the system window. The file that is generated is typically named edgeos\_ubnt\_<date>.tar.gz, with <date> replaced by numbers representing todays date.

To generate a backup file, first press the System button, as shown in Figure 9 – System Button. You will be presented with the System screen, as shown in Figure 10 – System Pop-up Screen.

Find and press the “Download” button under the Configuration Management & Device Management section. See Figure 33 – Back Up Config Download Button.

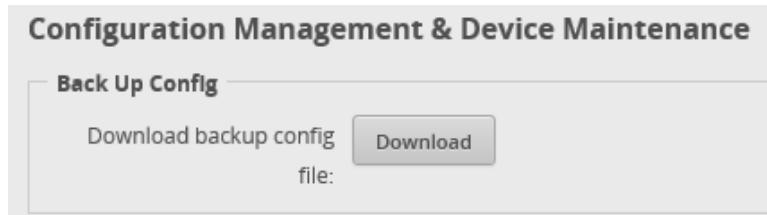

Figure 33 – Back Up Config Download Button

You will be presented with a dialog of where to (open or) save your backup file. This dialog is browser specific. Save your file to a directory of your choice on your setup computer. This file will be needed if you ever need to reload your EdgeRouter. You may want to do this frequently, when setting up this device.

Another way to obtain a relevant portion of this file is to issue one of the following commands into the Command Line Interface (CLI) window. For information about the CLI, reference section “15 - EdgeRouter Command Line Interface (CLI)”.

Two different / similar normal-mode CLI command for acquiring the system configuration are:

```
cat /config/config.boot  
show configuration | no-more  
show configuration | cat
```

I will show as many portions of this config data as possible throughout this guide. One goal of this guide is to teach users enough about this EdgeRouter that they are comfortable reading and understanding the backup files.

You would do well to save / keep multiple backup files, while you are working through this guide.

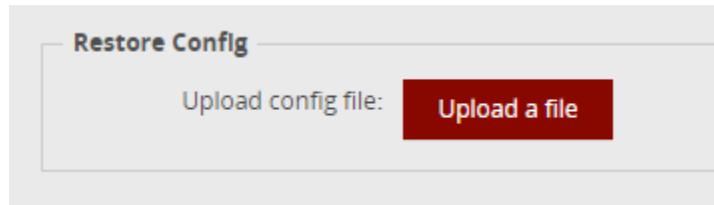

An alternate method of generating backup data is to issue one of these commands:

```
show configuration commands  
show configuration commands | cat
```

which dumps a list of configuration commands which should re-generate your installation. Internally generating this list has to be pretty crazy, since many commands will depend upon other commands having already been entered.

To restore a configuration file, first press the System button, as shown in Figure 9 – System Button. You will be presented with the System screen, as shown in Figure 10 – System Pop-up Screen.

Find and press the “Upload a file” button under the Configuration Management & Device Management section. See Figure 34 – Restore Config Upload a file Button.

**Figure 34 – Restore Config Upload a file Button**

You will be asked to select and “Open” a previously generated configuration file.

Note: Sometimes to upload a configuration file, you might need to first recover more space on your ER-X router. You can issue the CLI command:

```
delete system image
```

to recover more space. Note that this deletes the backup (configuration) image, not the running (configuration) image. Only do this command if you cannot otherwise update. Reference Section 15 - EdgeRouter Command Line Interface (CLI).

Link(s):

<https://help.ubnt.com/hc/en-us/articles/360002535514>

<https://community.ubnt.com/t5/EdgeRouter/Edgerouter-CLI-command/m-p/2728959>

## 19. Remove eth2 from the EdgeRouter's Internal Switch

In this optional step, we will manually un-bundle the eth2 interface from the EdgeRouter's internal switch chip to provide for the Wired Separate Network on the eth2 interface. Un-bundling this interface from switch0 enables a separate physical network. An additional network could be achieved by adding a logical VLAN, but we are choosing to implement an additional network on the physical eth2 port. The switch chip will remain enabled for eth3 and eth4 interfaces. Later, we will assign an IP address range to this port, setup DHCP to provide IP addresses to eth2 connected devices, and create firewall rules that will keep this Network isolated from the other Networks. If you choose to not implement the Wired Separate Network, there are other associated steps you will not perform.

Press the Dashboard Button. See Figure 35 – Dashboard Button.

Figure 35 – Dashboard Button

On the right side of the Dashboard screen, select switch0's "Actions" button. See Figure 36 – switch0's Action Button.

Figure 36 – switch0's Action Button

A sub-menu will appear, Select "Config" from the menu items. See Figure 37 – switch0 Actions Config.

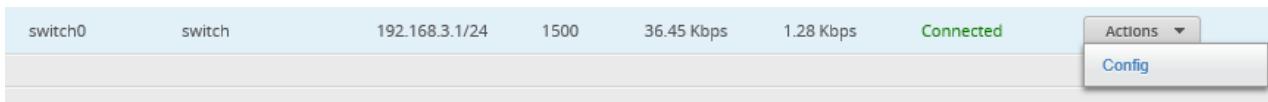

Figure 37 – switch0 Actions Config

You will be presented with the configuration dialog for switch0. See Figure 38 – switch0 Configuration.

Select the VLAN tab. Under the section labeled "Switch Ports", UN-CHECK eth2. See Figure 39 – switch0 Switch Ports.

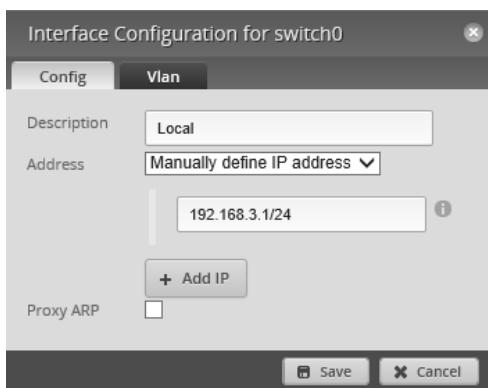

Figure 38 – switch0 Configuration

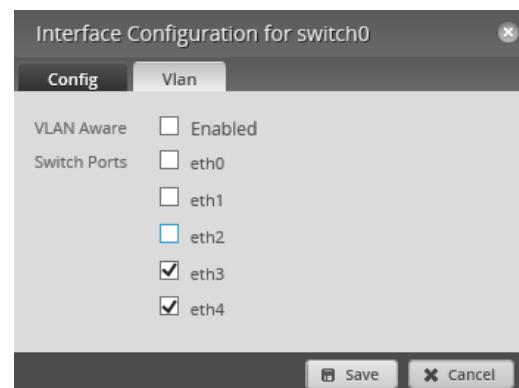

Figure 39 – switch0 Switch Ports

Press “Save”. While the EdgeRouter is completing this task, a busy indicator will spin, in the upper right corner of the dialog. See Figure 40 – Busy Indicator. Wait for the Busy Indicator to finish spinning. It will be replaced by a Green checkmark when the task is completed. See Figure 41 – Finished Checkmark.

**Figure 40 – Busy Indicator**

**Figure 41 – Finished Checkmark**

## 20. Configure EdgeRouter's eth2 IP Addresses

Now that the eth2 interface has been un-bundled, we need to allocate a new IP address range to this interface.

On the right side of the Dashboard screen select eth2's "Actions" button. See Figure 42 – eth2's Actions Button.

Figure 42 – eth2's Actions Button

A sub-menu will appear, See Figure 43 – Interface Actions.

Figure 43 – Interface Actions

Select "Config". You will be presented with Figure 44 – Configuration for eth2 Dialog.

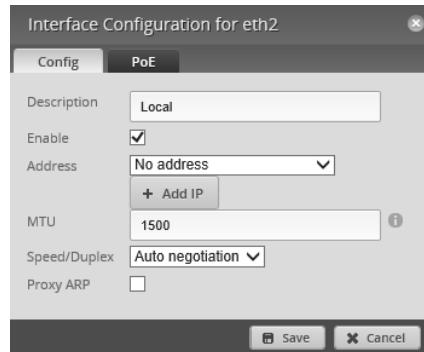

Figure 44 – Configuration for eth2 Dialog

Under the Address selection, choose "Manually define IP address", and enter "192.168.5.1/24" into the address field. See Figure 45 – eth2 Address Dialog.

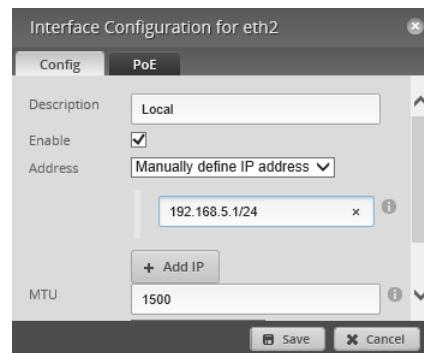

Figure 45 – eth2 Address Dialog

Click the Save button.

---

## 21. About DNS settings

I seem to have spent more time investigating DNS settings for the EdgeRouter than in learning firewall rules.

A DNS explanation: <https://www.cloudflare.com/learning/dns/what-is-dns/>

Within my router, and within this guide, I tried using Quad9 DNS addresses, but have now switched back to Level3 DNS addresses for the Home Network. For training / clarity purposes within this guide, I am using Google DNS resolvers for the Separate Network and within the EdgeRouter Itself. I am also using AND forcing OpenDNS DNS addresses for the IOT and Guest Networks. Some people have reported that Quad9 is slower, See Section 75 - Adblocking and Blacklisting as a security alternative.

Change any or all of the listed DNS providers to ones of your own choosing. These are used within this guide:

Level3 (CenturyLink) resolver addresses are	209.244.0.3	209.244.0.4
Google resolver addresses are	8.8.8.8	8.8.4.4
OpenDNS resolver addresses are	208.67.222.222	208.67.220.220

Steve Gibson has a web page that can help you characterize various DNS providers. Since it runs from your computer, the results are localized to your connection / ISP. Until the EdgeRouter is fully setup, you might want to run this from a computer that is currently wired outside of the EdgeRouter. This is shown as "Existing LAN" in Figure 2 - EdgeRouter Configuration Setup. The page is at:

<https://www.grc.com/dns/benchmark.htm>

Steve Gibson has another web page that tests the "spoofability" (security) of DNS resolvers. It is at:

<https://www.grc.com/dns/dns.htm>

Here are some alternate DNS resolvers, and additional DNS information pages:

[https://en.wikipedia.org/wiki/List\\_of\\_managed\\_DNS\\_providers](https://en.wikipedia.org/wiki/List_of_managed_DNS_providers)

Reference: <https://github.com/mjp66/Ubiquiti/issues/13> and <https://www.quad9.net/faq>

**Dns Crash Note:**

I've experienced some infrequent router crashes IN THE PAST. These crashes seem to involve dns and last about five minutes. During this time your router is ineffective. I've posted about this issue on the Ubiquiti forums and have not found a solution. Reference <https://community.ubnt.com/t5/EdgeRouter/ER-X-Dns-Forwarding-Not-Acting-Configured-Correctly/td-p/2301019>

You may not experience these crashes, or if you do, you may choose to just live with these symptoms. One workaround seems to be not using the ER-X's dnsmasq service as your Home Network resolver. If you don't use dnsmasq, you will lose the benefits of local caching and of being able to access Network devices by their local name. The workaround involves changing "DNS 1" and "DNS 2" to alternate (external) dns resolver IP addresses for LAN2 (the Home Network.) If you want to work around this issue, you should probably perform these changes when performing the actions in section 31 - Set Domain Names for Networks, remembering to additionally change LAN2.

[Update: I have not seen these in quite some time; I am using dnsmasq, and think newer ER-X firmware may have fixed these.]

## 22. dnsmasq

There are two different DNS packages available within the EdgeRouter. They are ISC (default) and dnsmasq. Dnsmasq was incomplete as of firmware 1.9.0 and had an additional bug added in firmware 1.9.1, I think it was re-broken and fixed during the hotfixes of 1.9.7. I now suggest that DON'T use ISC and that you DO use dnsmasq. See link "ER-X doesn't block dhcp server" further down in this section.

To enable dnsmasq, enter the Config Tree. Reference section "16 - EdgeRouter Config Tree." Select and open up the following config tree sub-menu items from the configuration screen:

```
service  
  dhcp-server
```

You should see some DHCP settings, including use-dnsmasq and hostfile-update. (Note, your screen will still show "disable"). See Figure 46 – use-dnsmasq.

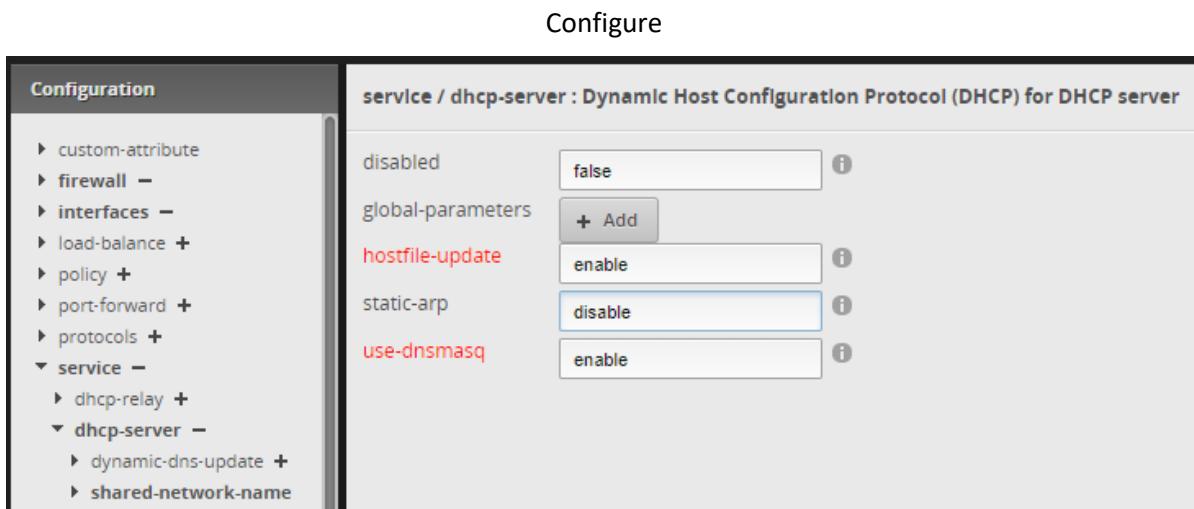

Figure 46 – use-dnsmasq

Type "enable" in the use-dnsmasq box and in the hostfile-update box. Then press the "Preview" button. See Figure 47 – commit-dnsmasq.

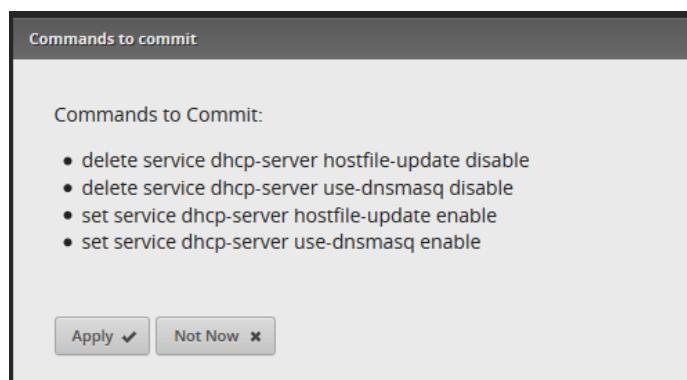

Figure 47 – commit-dnsmasq

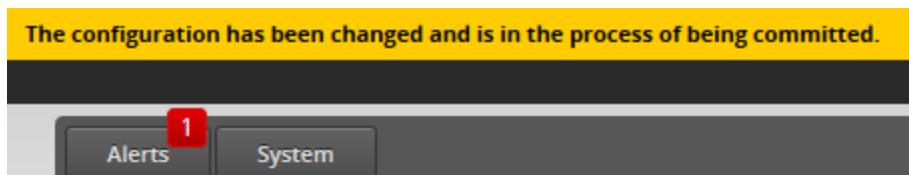

Press "Apply." You should see the message "The configuration has been applied successfully", in green, near the bottom of the screen.

With local hostname resolution, you can lookup different devices / PCs on your Network by just referencing the name of the device / PC. For instance, you can look up a second PC on your Home Network from another PC on your Home Network by referencing its name, i.e. by typing (example) "ping DifferentPcName" or by entering "<http://DifferentPcName>" (if it is a web server), etc.... You may need to add ".local" to the end of the name.

To allow local hostname resolution, perform the following changes. Drop into the Command Line Interface (CLI) and issue the following commands:

```
configure
set system name-server 127.0.0.1
set service dns forwarding listen-on switch0
set system domain-name home.local
commit
save
exit
```

You should see a yellow "The configuration has been changed and is in the process of being committed" message. See Figure 48 – The Configuration has been changed message

**Figure 48 – The Configuration has been changed message**

ER-X doesn't block dhcp server:

<https://community.ui.com/questions/ER-X-doesnt-block-dhcp-server/e2c9b13c-8bdf-43eb-8bcd-26637edbc648>

<https://loganmarchionne.com/2016/08/edgerouter-lite-dnsmasq-setup/>

---

## 23. Aliases for devices on your Network

The Edgerouter provides commands which allow you to generate an alias for addressing / accessing equipment on your local Network using a different / additional name. This equipment will need to have its IP address reserved. To reserve the devices IP address, see section 80 - Reserving Device Addresses via DHCP.

I originally saw this posing:

<https://community.ui.com/questions/dnsmasq-dhcp-hostnames-and-aliases/2e736a97-9f23-4ff0-a624-4ace4a6a7a2f>

Which led me to this help page:

<https://help.ui.com/hc/en-us/articles/115002673188>

Where I saw the following (example) commands:

```
set system static-host-mapping host-name uap-pro.ubnt.local inet <ip-address>
set system static-host-mapping host-name uap-pro.ubnt.local alias uap-pro
```

See section 15 - EdgeRouter Command Line Interface (CLI) for how to issue commands.

To play with this, I issued the following commands via CLI:

```
set system static-host-mapping host-name router.local inet 192.168.3.1
set system static-host-mapping host-name router.local alias router2.local
```

Using this example, I can now access my ER-X router using any of the following URLs:

<https://192.168.3.1/>  
<https://router.local/>  
<https://router2.local/>

FYI, the backup file now contained this additional text:

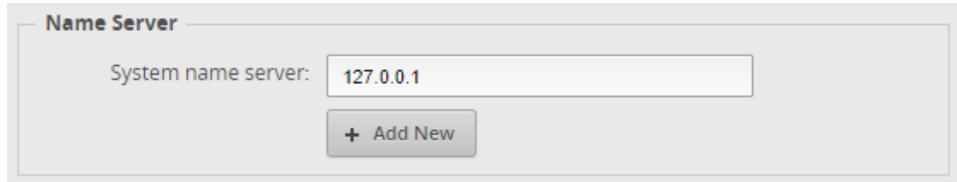

```
static-host-mapping {
    host-name router.local {
        alias router2.local
        inet 192.168.3.1
    }
}
```

## 24. System DNS Settings

This step instructs the EdgeRouter ITSELF to use specific DNS servers to resolve web URLs into IP addresses. These DNS servers are specified under the System widow.

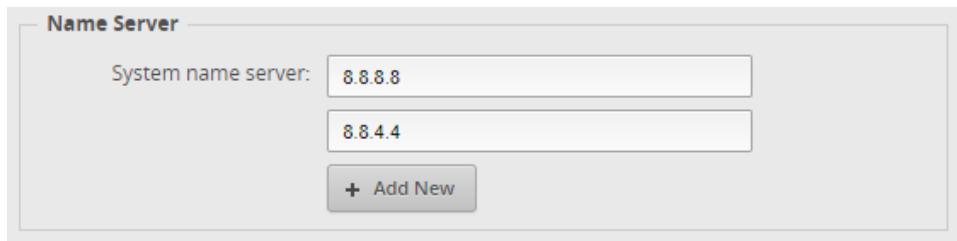

Press the “System” button. Reference Figure 9 – System Button.

On the system window, find the Name Server Box. See Figure 49 – Initial System Name Server.

**Figure 49 – Initial System Name Server**

Your box should already be filled-in with 127.0.0.1, as this was set by CLI in the previous section. You can leave it, or change it (as I did) to two DNS resolver addresses of your choice. I used Google addresses for this guide. Most external DNS resolver systems have multiple resolver addresses, in case of failure; ensure that you add both the primary and secondary resolver addresses by (erasing what is already there and/or) pressing the “+ Add New” button. See Figure 50 – Example Google DNS System DNS Entries.

**Figure 50 – Example Google DNS System DNS Entries**

When you are done editing, press the Save button near the bottom of the system page. See Figure 51 – System Save Button.

**Figure 51 – System Save Button**

---

## 25. Remove ISP Provided DNS Resolvers

I don't want to depend upon the DNS servers that are provided by my dsl / cable modem. The specific DNS resolver addresses are specified as part of the DHCP data, which is given to the EdgeRouter's eth0 WAN port from the dsl / cable modem. Performing the commands in this section is optional / up to you.

These ISP DNS servers are probably OK, but I don't trust the security of phone-company/cable-company provided modems. Consumer modems are typically full of unpatched security holes, and many have programmed backdoors in them. Commercial modems bulk produced by the lowest bidder and externally controlled by large, uncaring companies have got to be even worse.

In particular, there are DNS changer worms, which attack consumer / commercial routers and change their DNS resolver settings. The way to help circumvent this problem is to instruct the EdgeRouter to ignore the DHCP provided DNS resolver address from your commercial router / ISP.

Since the DNS changer worm could attack an EdgeRouter, remember to change the EdgeRouter's default password to something strong. You don't want to end up like these people:

<https://www.routersecurity.org/bugs.php>,

-> January 2018, -> MikroTik and Ubiquiti Routers defaced due to default passwords

To see the DNS resolvers being used by the EdgeRouter, issue the CLI command:

```
show dns forwarding nameservers.
```

(For information on the CLI, reference section "15 - EdgeRouter Command Line Interface (CLI)")

The following text shows the Google resolver addresses that were entered into the system page, and an ISP-provided resolver, delivered via my existing / upstream router, which has an address of 192.168.2.1:

```
-----  
Nameservers configured for DNS forwarding  
-----  
8.8.8 available via 'system'  
8.8.4.4 available via 'system'  
192.168.2.1 available via 'dhcp eth0'
```

To remove the ISP-provided nameserver, drop into the Command Line Interface (CLI) and issue the following commands:

```
configure  
set service dns forwarding system  
commit  
save  
exit
```

To see if this worked, re-issue the CLI command "show dns forwarding nameservers". This is what I got:

```
-----  
Nameservers configured for DNS forwarding  
-----  
8.8.8.8 available via 'optionally configured'  
8.8.4.4 available via 'optionally configured'  
  
-----  
Nameservers NOT configured for DNS forwarding  
-----  
192.168.2.1 available via 'dhcp eth0'
```

Reference <https://community.ubnt.com/t5/EdgeMAX/Change-WAN-DNS-Server/td-p/977885>

According to <https://github.com/mjp66/Ubiquiti/issues/11>, you would restore using your ISP's resolvers with the following commands:

```
configure  
delete service dns forwarding system  
set service dns forwarding listen-on eth0  
commit  
save  
exit
```

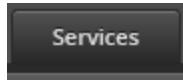

Some DNS references:

<https://community.ui.com/questions/Check-if-DNS-is-not-leaking-ISP-transparent-DNS/ad58975d-c21a-4c5b-9c99-c557abfdfb04>

---

## 26. Configure EdgeRouter's eth2 DHCP Server

Now that eth2 has been un-bundled, and has a unique IP subnet assigned to it, we need to provide a DHCP server on this port. Near the top of the screen select the “Services” button. See Figure 52 – Services Button.

**Figure 52 – Services Button**

Ensure that the “DHCP Server” tab is selected. See Figure 53 – DHCP Server Screen.

DHCP Server		DNS	PPPoE
<b>+ Add DHCP Server</b>			
Name	▲	Subnet	
LAN1		192.168.4.0/24	
LAN2		192.168.3.0/24	
Showing 1 to 2 of 2 entries			

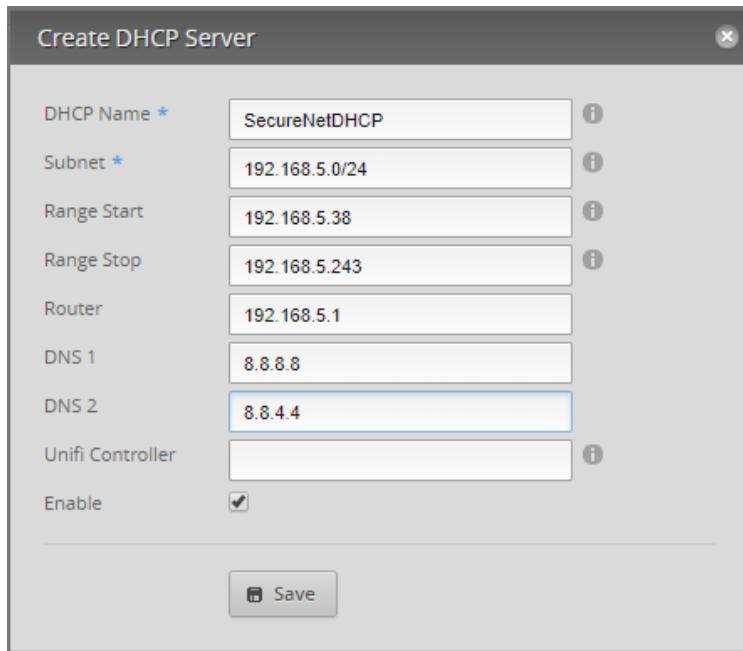

**Figure 53 – DHCP Server Screen**

Note that I am using Google DNS resolver addresses for DNS1 and DNS2 (below). You can change these to providers of your choice.

Click on the “+ Add DHCP Server” button. You will be presented with a Create DHCP Server dialog. See Figure 54 – Create eth2 DHCP Server Screen. Fill in the form as follows:

DHCP Name:	SecureNetDHCP
Subnet:	192.168.5.0/24
Range Start:	192.168.5.38
Range Stop:	192.168.5.243
Router:	192.168.5.1
DNS 1:	8.8.8.8
DNS 2:	8.8.4.4
Unifi Controller:	<Leave Blank>
Enable:	CHECKED

Click “Save.”

**Figure 54 – Create eth2 DHCP Server Screen**

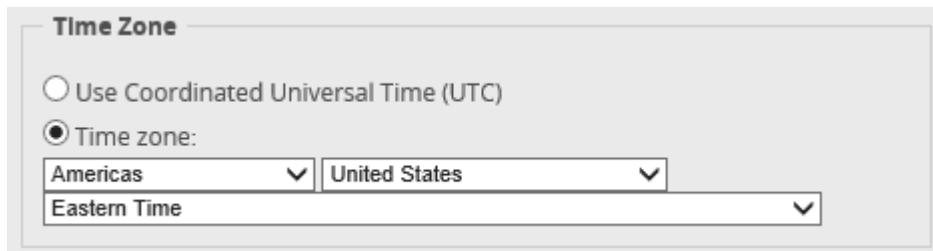

I used the same range start and range stop values (38 and 243) that the wan+2lan2 wizard used within the DHCP servers for LAN1 and LAN2.

For some reason, the Ubiquiti GUI programmers seem to have forgotten to include the setting of “authoritative enable” and “domain” from this GUI interface. Setting of those will come later.

---

## 27. Configure EdgeRouter’s Time Zone

Near the bottom of the screen select the “System” button. Reference Figure 9 – System Button. Find the section titled “Time Zone” and configure the data in these fields according to the time zone you are in, unless you want your router to remain in UTC. See Figure 55 – Time Zone.

**Figure 55 – Time Zone**

Press the Save button, Reference Figure 51 – System Save Button.

## 28. DNS Forwarding

Press the “Services” button, near the top right of the window. Reference Figure 52 – Services Button. Ensure that the “DNS” Tab is selected. See Figure 56 – DNS Tab.

The screenshot shows the 'DNS' tab selected in a software interface. The 'DNS Forwarding' section contains the following fields:

- Cache Size: 150
- Interface \*: eth1 (selected from a dropdown menu)
- Listen Interface: switch0 (selected from a dropdown menu)
- Buttons: - Remove, + Add Listen Interface

At the bottom are standard save buttons: Delete, Cancel, and Save.

Figure 56 – DNS Tab

I changed my cache size to 400. We want to remove eth1 from this list. Change the first item (which can't be removed) to “switch0”. Then press the “- Remove” button to the right of the second item. The result should look like Figure 57 – Remove eth1 from DNS. Press “Save.”

The screenshot shows the 'DNS' tab selected in a software interface. The 'DNS Forwarding' section contains the following fields:

- Cache Size: 400
- Interface \*: switch0 (selected from a dropdown menu)
- Buttons: - Remove, + Add Listen Interface

At the bottom are standard save buttons: Delete, Cancel, and Save.

Figure 57 – Remove eth1 from DNS Forwarding

## 29. Add VLAN Networks to the EdgeRouter

The Ubiquiti AC-AP-LR Wi-Fi access point can manage up to four separate Networks / SSIDs, by using VLANS. VLANS allow separated IP data to flow over one Ethernet cable, without the data being mixed together. This section will create three new Networks using VLANS.

Press the Dashboard button near the top of the Screen. Reference Figure 35 – Dashboard Button. On the upper left side of the Dashboard screen select the Add Interface button. See Figure 58 – Add Interface Button

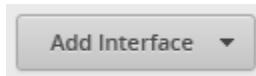

Figure 58 – Add Interface Button

The Add Interface menu will appear. Select “Add VLAN”. See Figure 59 – Add Interface Menu

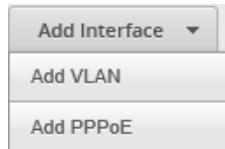

Figure 59 – Add Interface Menu

You will be presented with the “Create New VLAN” dialog. Fill in the information as follows:

VLAN ID: 6  
Interface: switch0  
Description: “Wifi Guest Net”  
MTU: 1500  
Address: Manually define IP address  
192.168.6.1/24

The AC-AP-LR access point will eventually be connected to the eth4 interface. The eth3 and eth4 interfaces are internally using the switch0 chip. Therefore, this VLAN needs to be attached to switch0, not to eth3 or to eth4. See Figure 60 – Create New VLAN Example. Press the “Save” button.

A screenshot of a modal dialog window titled "Create New VLAN". The window has a light gray background and a dark gray header bar. It contains five input fields with labels and dropdown menus:

- VLAN ID \*: A text input field containing the value "6".
- Interface \*: A dropdown menu currently set to "switch0".
- Description: A text input field containing the value "Wifi Guest Net".
- MTU: A text input field containing the value "1500".
- Address: A dropdown menu currently set to "Manually define IP address". Below it is a text input field containing the value "192.168.6.1/24".

At the bottom of the dialog are two buttons: "Save" (with a disk icon) and "Cancel" (with a cross icon).

Figure 60 – Create New VLAN Example

Repeat the above steps two more times, for adding two more VLANs. Fill in the information as follows:

VLAN ID: 7  
Interface: switch0  
Description: "Wifi Iot Net"  
MTU: 1500  
Address: Manually define IP address  
192.168.7.1/24

VLAN ID: 8  
Interface: switch0  
Description: "Wifi Spare Net"  
MTU: 1500  
Address: Manually define IP address  
192.168.8.1/24

There are the relevant sections from the backup file:

```
vif 6 {  
    address 192.168.6.1/24  
    description "Wifi Guest Net"  
    mtu 1500  
}  
vif 7 {  
    address 192.168.7.1/24  
    description "Wifi Iot Net"  
    mtu 1500  
}  
vif 8 {  
    address 192.168.8.1/24  
    description "Wifi Spare Net"  
    mtu 1500  
}
```

Here is a link discussing using VLANs and managed switches to reduce the number of network cables in a home:  
<https://community.ubnt.com/t5/EdgeMAX/Need-recommendation-on-tweaking-config-to-support-some-VLAN/td-p/2155404>

When originally writing this guide, I was not able to figure out how to combine the Wired IOT Network (as 192.168.4.X) and the Wi-Fi IOT Network (as 192.168.7.X) as a single Network / Subnet. I now enable the internal ER-X switch chip to be VLAN aware, which solves this. Those steps are in section 83 - Coalescing the Wired Iot and Wifi Iot Networks. You should just wait to do this until you get to that section, or you might not be able to follow-along in this guide. To instead perform those steps now, I would have to re-write most of this guide and re-take too-many screenshots.

---

## 30. Add DHCP Servers to the VLANs

Following the directions that are in the section titled “26 - Configure EdgeRouter’s eth2 DHCP Server”, add DHCP servers for the three VLANs that were just created. Note that I am using Open DNS servers for these networks. If you change them here, you will also need to manually modify some firewall / NAT rules, presented later within this guide.

The information for VLAN 6, is as follows:

DHCP Name:	WifiGuestDHCP
Subnet:	192.168.6.0/24
Range Start:	192.168.6.38
Range Stop:	192.168.6.243
Router:	192.168.6.1
DNS 1:	208.67.222.222
DNS 2:	208.67.220.220
Unifi Controller:	<Leave Blank>
Enable:	CHECKED

The information for VLAN 7, is as follows:

DHCP Name:	WifilotDHCP
Subnet:	192.168.7.0/24
Range Start:	192.168.7.38
Range Stop:	192.168.7.243
Router:	192.168.7.1
DNS 1:	208.67.222.222
DNS 2:	208.67.220.220
Unifi Controller:	<Leave Blank>
Enable:	CHECKED

The information for VLAN 8, is as follows:

DHCP Name:	WifiSpareDHCP
Subnet:	192.168.8.0/24
Range Start:	192.168.8.38
Range Stop:	192.168.8.243
Router:	192.168.8.1
DNS 1:	208.67.222.222
DNS 2:	208.67.220.220
Unifi Controller:	<Leave Blank>
Enable:	CHECKED

You should now have six DHCP servers.

## 31. Set Domain Names for Networks

Near the top of the screen select the “Services” button. Reference Figure 52 – Services Button. Ensure that the “DHCP Server” tab is selected. Reference Figure 53 – DHCP Server Screen

Find the LAN1 line, and follow it to the right side, to the line’s “Actions” button. Click the “Actions” button. You will be presented with a list of actions. Choose “View Details”. See Figure 61 – DHCP Actions.

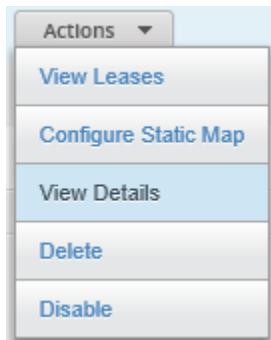

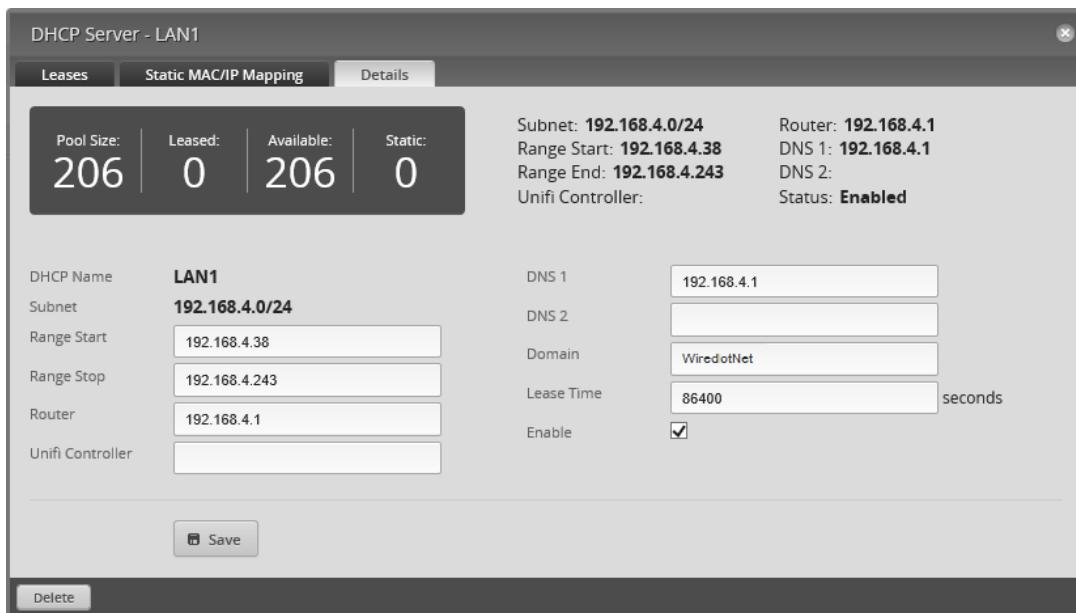

Figure 61 – DHCP Actions

A dialog will open. See Figure 62 – DHCP Server Details Dialog.

Leases	Static MAC/IP Mapping	Details
Pool Size: 206	Leased: 0	Available: 206
Static: 0		
Subnet: 192.168.4.0/24 Range Start: 192.168.4.38 Range End: 192.168.4.243 Unifi Controller:		
DHCP Name: <b>LAN1</b>	DNS 1: 192.168.4.1	
Subnet: <b>192.168.4.0/24</b>	DNS 2:	
Range Start: 192.168.4.38	Domain: WiredotNet	
Range Stop: 192.168.4.243	Lease Time: 86400 seconds	
Router: 192.168.4.1	Enable: <input checked="" type="checkbox"/>	
Unifi Controller:		

Figure 62 – DHCP Server Details Dialog

Fill-in the “Domain” field with:

WiredotNet

and then click “Save.” When it is done updating, close the dialog.

Repeat these steps for the following DHCP Servers as show in Table 2 - Table of Domain Names (You have just done the first one of them):

DHCP Servers	Domain
LAN1	WiredlotNet
LAN2	HomeNet
SecureNetDHCP	SeparateNet
WiFiGuestDHCP	WifiGuestNet
WifiIOTDHCP	WifilotNet
WifiSpareDHCP	WifiSpareNet

**Table 2 - Table of Domain Names**

---

## 32. Modify EdgeRouter's eth1 DHCP Server

Select the "Services" button. Reference Figure 52 – Services Button.

Ensure that the "DHCP Server" tab is selected. Reference Figure 53 – DHCP Server Screen

Select the "Action" button to the right of the "LAN1" line. Reference Figure 61 – DHCP Actions.

Choose "View Details." Reference Figure 62 – DHCP Server Details Dialog.

Modify / enter the following information:

DNS 1: 208.67.222.222  
DNS 2: 208.67.220.220

These DNS addresses have the equipment on the Wired Iot Network use Open DNS resolvers. If different resolver addresses are used here, then some firewall rules (and probably group addresses) will also need to be modified. Covered later in this guide.

---

### 33. Rename DHCP Servers

When the Wizard setup our EdgeRouter, it named the two original networks as LAN1 and LAN2. To rename them, enter the CLI. Reference section 15 - EdgeRouter Command Line Interface (CLI). Type the following commands into the CLI window:

```
configure
edit service dhcp-server
rename shared-network-name LAN1 to shared-network-name WiredIotDHCP
rename shared-network-name LAN2 to shared-network-name HomeNetDHCP
commit
save
exit
```

Exit the CLI interface.

## 34. Make DHCP Servers “authoritative”

The EdgeRouter does not default any newly created DHCP servers to “authoritative.” This means that devices on the added Networks can take a long time to acquire an IP address. The Networks that were added by the Wizard (LAN1 and LAN2) are made authoritative by default.

Enter the Config Tree. Reference section “16 - EdgeRouter Config Tree.” Select and open up the following config tree sub-menu items from the configuration screen:

```
service
  dhcp-server
    shared-network-name
```

Click on the DHCP server you want to configure; in this case, it is:

SecureNetDHCP

You should see some DHCP settings, including authoritative. (Note, your screen will still show “disable”). See Figure 63 – Authoritative Example.

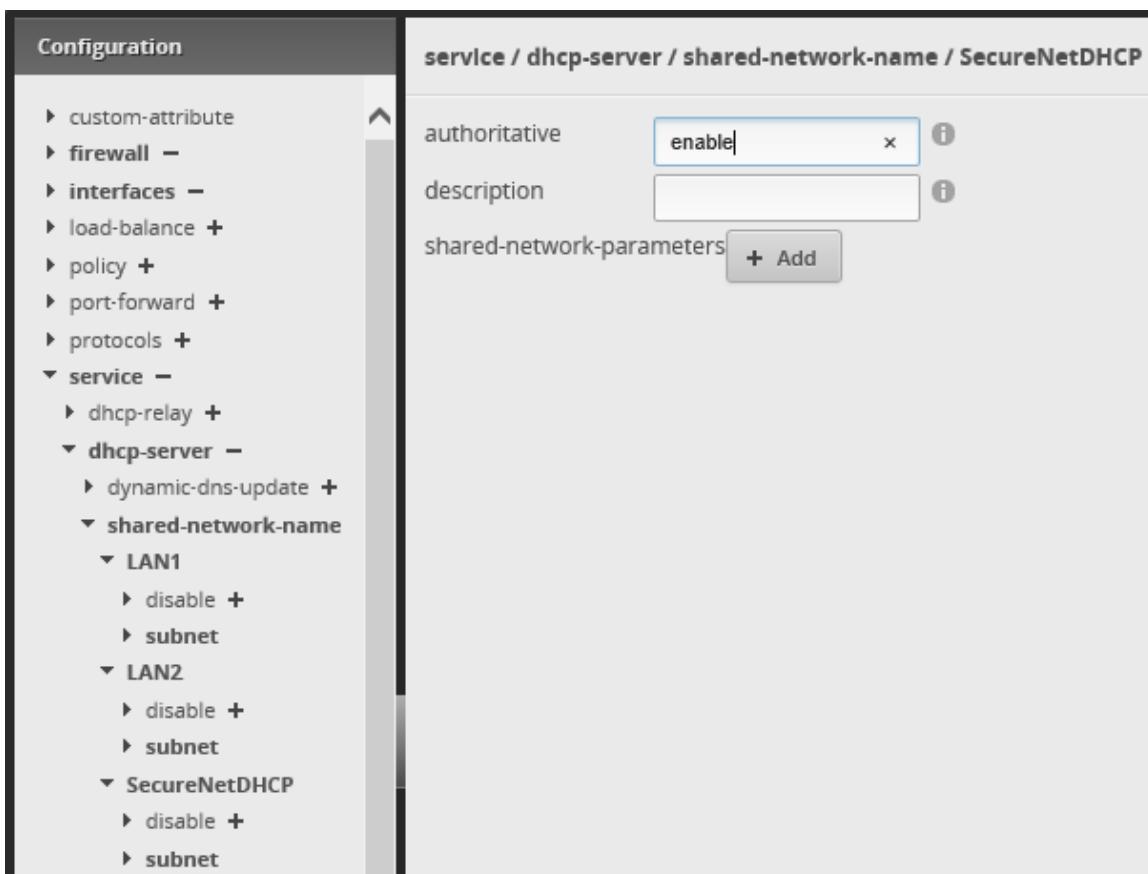

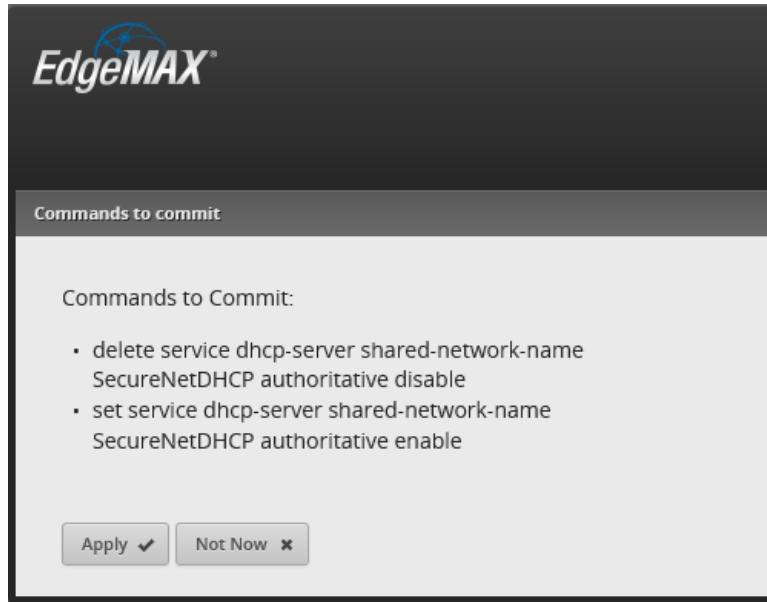

Figure 63 – Authoritative Example

Type “enable” in the authoritative box. Then press the “Preview” button. See Figure 64 – Authoritative Commit.

**Figure 64 – Authoritative Commit**

Press “Apply.” You should see the message “The configuration has been applied successfully”, in green, near the bottom of the screen.

Repeat these steps for the following Authoritative DHCP Servers as shown in Table 3 - Table of Authoritative DHCP Servers. (You have just done the first one of them):

Authoritative DHCP Servers
SecureNetDHCP
WiFiGuestDHCP
WifilotDHCP
WifiSpareDHCP

**Table 3 - Table of Authoritative DHCP Servers**

Shown below are excerpts of three of the five DHCP sections from the backup file:

```

dhcp-server {
    disabled false
    hostfile-update disable
    shared-network-name HomeNetDHCP {
        authoritative enable
        subnet 192.168.3.0/24 {
            default-router 192.168.3.1
            dns-server 192.168.3.1
            domain-name HomeNet
            lease 86400
            start 192.168.3.38 {
                stop 192.168.3.243
            }
        }
    }
    shared-network-name SecureNetDHCP {
        authoritative enable
        subnet 192.168.5.0/24 {
            default-router 192.168.5.1
            dns-server 209.244.0.3
            dns-server 209.244.0.4
            domain-name SeparateNet
            lease 86400
            start 192.168.5.38 {
                stop 192.168.5.243
            }
        }
    }
    shared-network-name WifiGuestDHCP {
        authoritative enable
        subnet 192.168.6.0/24 {
            default-router 192.168.6.1
            dns-server 208.67.222.222
            dns-server 208.67.220.220
            domain-name WifiGuestNet
            lease 86400
            start 192.168.6.38 {
                stop 192.168.6.243
            }
        }
    }
    use-dnsmasq enable
}

```

## 35. EdgeRouter Enable HW NAT Assist

Enabling “hwnat” turns on some features of a hardware switching chip that is within the EdgeRouter. This chip assists the EdgeRouter’s CPU with routing and NAT functionality, speeding up the operation of the EdgeRouter X.

Without this hardware assist, routing of packets is relatively slow. Be warned; if Quality of Service (QoS) functionality is enabled, then this hwnat assist is internally / automatically disabled. You also don’t want to enable bridging, since bridging is implemented via the CPU of the EdgeRouter X and is also relatively slow.

With hwnat enabled, many people report 800 – 900Mbps throughput.

Open up the Configuration Tree. Reference section 16 - EdgeRouter Config Tree.

Select and open up the following config tree sub-menu items from the configuration screen:

system  
offload

In the hwnat setting area, type:

enable

then select the “Preview” button at the bottom of the page.

See Figure 65 – System Offload Hwnat Selection (Partial).

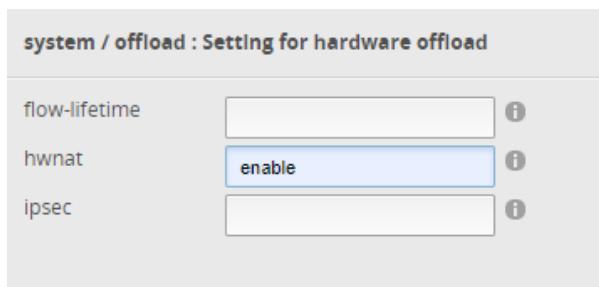

Figure 65 – System Offload Hwnat Selection (Partial)

The Edgerouter will preview what command(s) it will issue. See Figure 66 – Preview hwnat Config.

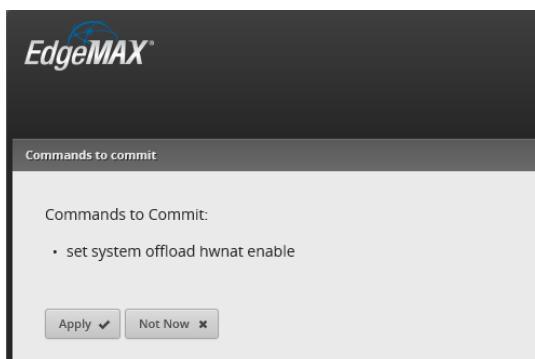

Figure 66 – Preview hwnat Config

Press “Apply.” The system will inform you that, “The configuration has been applied successfully”. See Figure 67 – hwnat Success

Figure 67 – hwnat Success

The above config-tree hwnat-enable could have been performed with the following CLI commands:

```
configure
set system offload hwnat enable
commit
save
exit
```

Compare the above command(s) with the command that the config-tree automatically issued in Figure 66 – Preview hwnat Config.

Remember that different models of EdgeRouters have different abilities / hardware assisting chips within them. Their commands may be different.

---

## 36. EdgeRouter ER-X Speed

The ER-X router seems capable of routing about 1Gbit/second aggregate/total, i.e. the sum of all input/output is 1Gbit/second. Note that most speed tests run separate download and separate upload tests.

The following article is well worth reading about the internals of the ER-X hardware:

<http://kazoo.ga/re-visit-the-switch-in-edgerouter-x/>

Other performance references:

<https://community.ubnt.com/t5/EdgeMAX/Performance-of-EdgerouterX-vs-Edgerouter-Lite/td-p/1230924>

<https://community.ubnt.com/t5/EdgeMAX/EdgeRouter-X-low-throughput-slow/td-p/1392229>

<https://community.ubnt.com/t5/EdgeMAX/ER-X-vs-ER-Lite-Head-to-Head-Speed-Results-on-Google-Fiber/td-p/1839844>

<https://www.stevejenkins.com/blog/2017/02/edgerouter-x-vs-edgerouter-lite-google-fiber-speed-tests/>

<https://community.ubnt.com/t5/EdgeMAX/Edgerouter-X-Fios-Gigabit-Won-t-go-over-500-Mbps/td-p/1910761>

## 37. EdgeRouter Enable Traffic Analysis

This step will enable the EdgeRouter to perform Deep Packet Inspection (DPI) / Traffic Analysis. If you have any speed issues with your ER-X, then this may need to stay off.

Press the “Traffic Analysis” button, near the top right of the screen. See Figure 68 – Traffic Analysis Button.

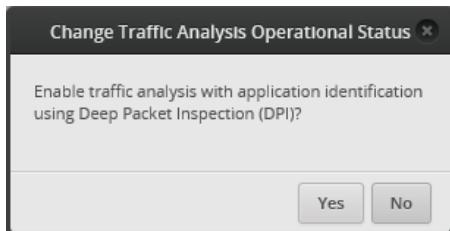

**Figure 68 – Traffic Analysis Button**

In the upper-right area of the traffic analysis screen, is an “Operational Status” selection. Select “Enabled.” See Figure 69 – Enable Operational Status

**Figure 69 – Enable Operational Status**

You will be presented with a confirmation dialog. See Figure 70 – Operational Status Confirmation.

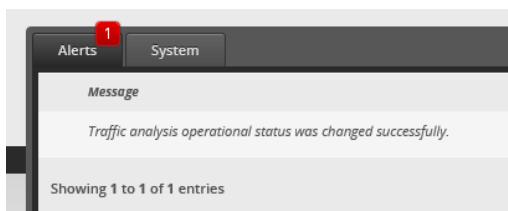

**Figure 70 – Operational Status Confirmation**

Select “Yes.” The software will (for some reason) present you with an Alert. This is seen in the lower-left of the screen. See Figure 71 – Active Alert.

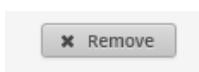

**Figure 71 – Active Alert**

Click on the “Alerts” button. You will be presented with the Alert message(s). See Figure 72 – Active Traffic Analysis Message.

**Figure 72 – Active Traffic Analysis Message**

To remove this Alert message, press the “Remove” button, located on the right side of the screen. See Figure 73 – Remove Alert Button

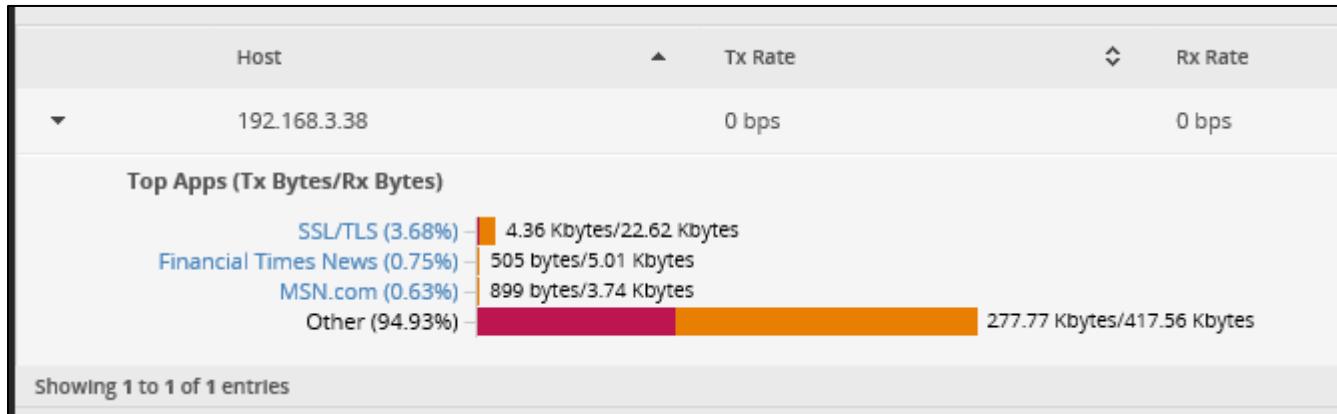

**Figure 73 – Remove Alert Button**

## 38. EdgeRouter Traffic Analysis

The Traffic Analysis performed by the EdgeRouter X initially looks pretty neat. The following screen shot was taken when the Edgerouter was at this configuration step in generating this configuration document. The EdgeRouter had been booted for 41 minutes.

The only thing I had done, since I booted the “setup” computer, was to configure the EdgeRouter. I NEVER purposefully go to MSN.com, or to the Financial Times News. I only assume that those web lookups are from Microsoft’s Internet Explorer / Microsoft performing their Windows 10 monetization of their users, sometimes referred to as “spying.” See Figure 74 –Sample Traffic Analysis

In real use, this feature there seems to put a lot of uncharacterized traffic under “Other.”

**Figure 74 –Sample Traffic Analysis**

Note that when HW NAT Assist is enabled, some traffic, which is handled by the internal switch chip, is not shown in traffic analysis. That is because Traffic Analysis is a CPU function, and the traffic that is being handled internally by the switch chip is not visible to the CPU. Note that traffic which is between two devices on the same Network does not even transit to the EdgeRouter, so this traffic will never be shown. The configuration used in this guide has setup the switch0 chip to only move traffic between eth3 and eth4, which is the Home Net (Network).

Traffic Analysis data cannot be exported out of the EdgeRouter.

Turns out that some of this Traffic Analysis data can trigger firewall rules:

[https://www.youtube.com/watch?v=tNG\\_Fq5Sjcg](https://www.youtube.com/watch?v=tNG_Fq5Sjcg)

<https://www.youtube.com/watch?v=d2Mz7Nin4vQ>

---

## 39. EdgeMAX EdgeRouter X/X-SFP bootloader update

ER-X's, which have firmware versions of 1.10.7 or above, have a newer bootloader available and/or newer method of bootloader update. You will want to update your bootloader. Reference:

<https://help.ubnt.com/hc/en-us/articles/360009932554-EdgeRouter-How-to-Update-Bootloader>

Per the above link, I ran the following CLI / SSH / PuTTY command:

```
show system boot-image
```

and got the following text:

```
The system currently has the following boot image installed:  
Current boot version: UNKNOWN  
Current boot md5sum : 7580ebd7ce9303243292f586ab7c6daf  
New uboot version is available: boot_e50_001_1e49c.tar.gz  
New boot md5sum : 2146fb2e3b2cd543efaa0a687e2ad0ce  
Run "add system boot-image" to upgrade boot image.
```

I updated my bootloader with `add system boot-image` (and yes) and then got the following text:

```
Uboot version [UNKNOWN] is about to be replaced  
Warning: Don't turn off the power or reboot during the upgrade!  
Are you sure you want to replace old version? (Yes/No) [Yes]: yes  
Preparing to upgrade...Done  
Copying upgrade boot image...Done  
Checking boot version: Current is UNKNOWN; new is e50_001_1e49c ...Done  
Checking upgrade image...Done  
Writing image...Done  
Upgrade boot completed
```

I then re-ran the following command: `show system boot-image` and got the following text:

```
The system currently has the following boot image installed:  
Current boot version: e50_001_1e49c  
Current boot md5sum : 2146fb2e3b2cd543efaa0a687e2ad0ce
```

Next, issue the `reboot` command and when prompted with the prompt:

```
Proceed with reboot? [confirm]
```

Type a single `y` character to confirm the reboot.

You will need to wait about 3 to 5 minutes.

After the re-boot, I re-ran the following command: `show system boot-image` and got the following text:

```
The system currently has the following boot image installed:  
Current boot version: e50_001_1e49c  
Current boot md5sum : 2146fb2e3b2cd543efaa0a687e2ad0ce
```

---

## 40. EdgeRouter X/X-SFP Legacy Bootloader Information

### Part 1

Older bootloaders have an initialization issue in the bootloader for the ER-X and ER-X-SFP models that causes all ports to act as a "switch" during a brief period of time when the router is booting up.

When this guide was written, Ubiquiti had still not updated their production line to incorporate the patched bootloader.

Reference <https://community.ubnt.com/t5/EdgeMAX/EdgeRouter-X-acts-as-switch-during-boot/td-p/1393679>

### Part 2

For pre 1.10.6 firmware, check the version of your bootloader per:

<https://community.ubnt.com/t5/EdgeMAX/EdgeRouter-X-X-SFP-check-bootloader-version/td-p/1617287>

Some postings may be missing the “s” in “firmwares”.

### Part 3

Older bootloader (pre 1.10.6) updating is follows:

If your bootloader is not the newest, update your bootloader per:

<http://community.ubnt.com/t5/EdgeMAX-Updates-Blog/EdgeMAX-EdgeRouter-X-X-SFP-bootloader-update/ba-p/1472216>

<https://community.ubnt.com/t5/EdgeMAX-Updates-Blog/DEPRECATED-EdgeMAX-EdgeRouter-X-X-SFP-bootloader-update/ba-p/1472216>

It is much easier to update the EdgeRouter’s bootloader when the EdgeRouter is connected to the internet.

You may need to prepend “sudo” to one or more of the following commands, to get this to work:

<https://community.ubnt.com/t5/EdgeMAX/ERX-bootloader-update/td-p/1892923>

<https://community.ubnt.com/t5/EdgeRouter/ER-X-bootloader-update-versions/td-p/2134544>

---

## 41. EdgeOS file system layout and firmware images

@BranoB made the following interesting posting:

<https://community.ubnt.com/t5/EdgeRouter/EdgeOS-file-system-layout-and-firmware-images/m-p/2377075>

---

## 42. EdgeRouter Power Cycle Warning

Generally, you should use the reboot button that is located on the system screen to restart the EdgeRouter; don't simply remove power to the EdgeRouter, if you can help it.

Reference **TBD**

---

## 43. EdgeRouter UPnP

Don't enable UPnP. UPnP allows anything on your network (PCs / PCs with malware / Chinese IOT devices) to silently open ports in your firewall and let their friends and servers back in to feast on your private data.

If you need to connect devices like an Xbox behind your EdgeRouter, then manually open / forward the firewall ports by hand. If you really want UPnP, I've got a slightly used D-Link router for sale, which probably has lots of holes already in its firewall. Just ask the Federal Trade Commission who is suing D-Link.

References ( I have not tried any of these and I don't have an Xbox):

<https://help.ui.com/hc/en-us/articles/217367937-EdgeRouter-Port-Forwarding>

[https://www.reddit.com/r/HomeNetworking/comments/8a8ljb/another\\_xbox\\_one\\_nat\\_edgerouterx\\_help\\_post/](https://www.reddit.com/r/HomeNetworking/comments/8a8ljb/another_xbox_one_nat_edgerouterx_help_post/)

<https://support.microsoft.com/en-us/help/4026770/xbox-open-these-network-ports-for-xbox-one>

---

## 44. Extended GUI Access / Use May Crash the EdgeRouter

Leaving the EdgeRouter's GUI interface up for extended periods of time (maybe like a day or so) may crash the Edgerouter.

I can't find my original reference, so here is a related one:

One specific example is leaving the GUI open which can cause an unexpected reboot.

We are currently working on a fix for this. It's not convenient,

but staying out of the GUI may prevent these reboots assuming it is the same cause.

<https://community.ubnt.com/t5/EdgeMAX/ER-PRO-8-random-reboots-1-9-7-hotfix-1/td-p/2033684>

---

## 45. EdgeRouter Toolbox

In the upper right side of the main page, is a Toolbox button. When you click on it, you will see some nice utilities. See Figure 75 –Toolbox Items.

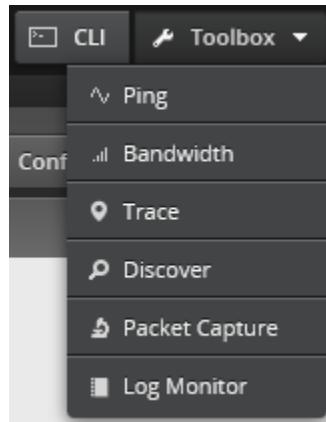

Figure 75 –Toolbox Items

There is a handy log monitor here:

<https://community.ubnt.com/t5/EdgeRouter/Viewing-Firewall-Logs-in-GUI/mp/2686126/highlight/true#M241809>

## 46. Address Groups

The software in the EdgeRouter allows the user to define Address Groups. These groups are used for convenience. We will define a couple of address groups. This guide previously used multiple address groups, one for each Network. Those address groups have recently been converted into simpler “Interface Networks”. This change will be explained later.

Select the “Firewall/NAT” Button from the top of the screen. See Figure 76 – Firewall/NAT Button.

Figure 76 – Firewall/NAT Button

From the tabs that are shown, select “Firewall/NAT Groups”. See Figure 77 – Firewall/NAT Groups Tab.

Figure 77 – Firewall/NAT Groups Tab

Find the “+ Add Group” button and click it. See Figure 78 – Add Group Button.

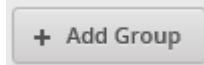

Figure 78 – Add Group Button

You will see the “Create New Firewall/NAT Group” dialog. Fill in this form as follows:

Name: OPENDNS\_SERVERS\_GROUP  
Description: OpenDNS Servers  
Group Type: Address Group.

See Figure 79 – Example New Address Group Dialog. Press “Save.”

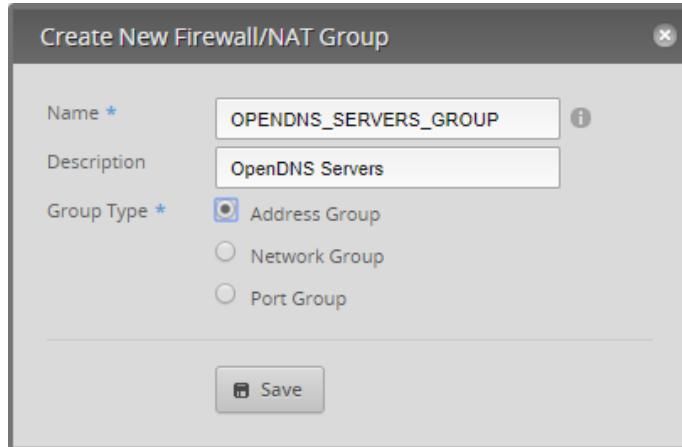

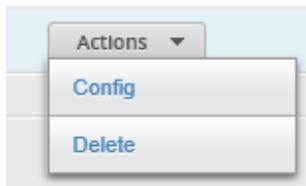

Figure 79 – Example New Address Group Dialog

An empty Address group will have been added. Note that the “Number of group members” is 0. See Figure 80 – Added Address Group.

Name	Description	Type	Number of group members	Actions
OPENDNS_SERVERS_GROUP	OpenDNS Servers	address-group	0	<button>Actions</button>

**Figure 80 – Added Address Group**

Press the OPENDNS\_SERVERS\_GROUP ‘s Action button and select Config. See Figure 81 – Address Group Actions

**Figure 81 – Address Group Actions**

Enter the address specifier of:

208.67.222.222

Press the “+ Add New” button and then add

208.67.220.220

See Figure 82 – Example Edit Address Group. Press “Save.” When it is finished updating, close the dialog.

A screenshot of a modal dialog titled "Edit Firewall/NAT Group". The dialog has a dark header bar with the title. Below it is a form with fields: "Name" (OPENDNS\_SERVERS\_GROUP), "Description" (OpenDNS Servers), and "Address \*". There are two input fields containing "208.67.222.222" and "208.67.220.220". At the bottom left is a "+ Add New" button, and at the bottom right is a "Save" button.

**Figure 82 – Example Edit Address Group**

Repeat the above steps for the following address groups. If there is more than one address listed in a group, then you will need to use the “+ Add New” button to add additional address(es) to the group. You have just done the OPENDNS\_SERVERS\_GROUP.

```
group {
    address-group OPENDNS_SERVERS_GROUP {
        address 208.67.222.222
        address 208.67.220.220
        description "OpenDNS Servers"
    }
    address-group RFC-1918_GROUP {
        address 192.168.0.0/16
        address 172.16.0.0/12
        address 10.0.0.0/8
        description "RFC-1918 Group"
    }
}
```

The above text section is from the backup file.

## 47. EdgeRouter Layman's Firewall Explanation

I initially had trouble understanding the EdgeRouter's firewall rules. The firewall rules that I saw on the internet appeared backwards (in direction) to me. I also didn't understand what "local" rules meant or applied to. Then I found the article "Layman's firewall explanation".

Reference: <https://community.ubnt.com/t5/EdgeMAX/Layman-s-firewall-explanation/td-p/1436103>

I highly recommend that you stop and read that entire posting now.

I have re-produced the main diagram, from that article, as Figure 83 – Layman's Firewall Explanation Diagram. Note that this diagram is for an EdgeRouter Lite, which has its WAN port on eth1. The WAN interface is therefore shown in the middle of this diagram.

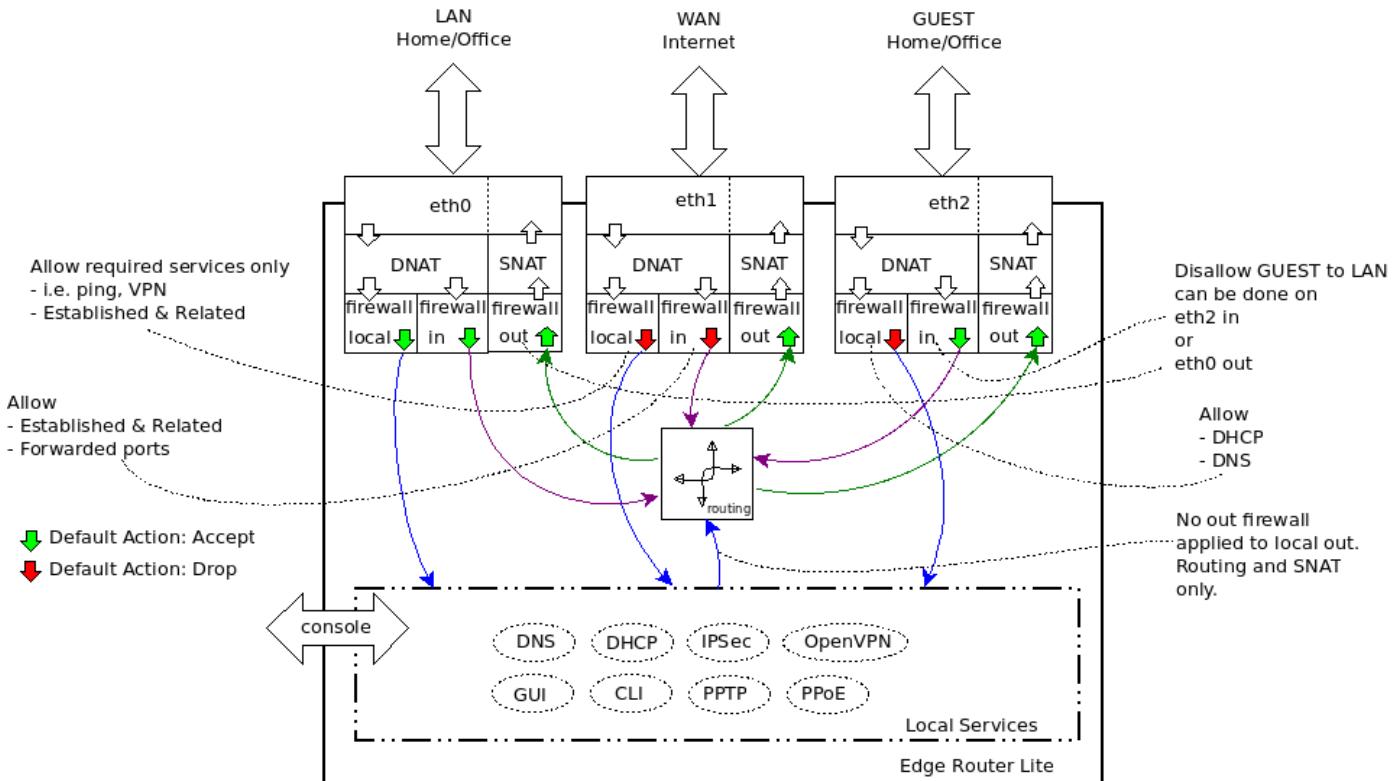

Figure 83 – Layman's Firewall Explanation Diagram

A firewall policy (ruleset) is a set of firewall rules along with a default action. The default action can be "accept," "reject," or "drop." A firewall ruleset is applied to a specific interface as well as applied to a specific "direction." For an EdgeRouter, the directions are "In," "Out," and "Local." The **"In"** direction is input IP packets from the internet, as well as **input into the EdgeRouter** from devices on a Network (LAN). The **"Out"** direction consists of IP packets **output from the EdgeRouter** destined for the internet, as well as output to your Network devices from the EdgeRouter. "Local" refers to IP data coming into the EdgeRouter destined for (services on the) EdgeRouter itself. Reference Figure 83 – Layman's Firewall Explanation Diagram. **The In and Out directions are referenced as viewed from the EdgeRouter.**

Each firewall rule, within a ruleset, also has an action of "accept," "reject," or "drop." Each IP packet attempting to traverse an interface that has firewall rules will be tested by the individual firewall rules, in the ruleset order, until a firewall rules matches the rule's condition criteria. The individual firewall rules contain conditions that need to all be matched for that firewall rule to perform its action. If no firewall rules match an IP packet, then the ruleset's default action is taken for that packet. Once an IP packet matches an individual firewall rule, no other firewall processing is needed for that IP packet.

Firewall rules within the ruleset are applied (tested) in the specific order that they were arranged. Therefore, it is important to order the firewall rules so that the most frequently used rules are arranged at or near the top of the set of rules, allowing for efficiency within the EdgeRouter.

Sometimes the firewall rule numbers seem to increment by one and sometimes they increment by ten. I think that different versions of EdgeRouter firmware have implemented numbering differently, so don't worry if your firewall rule's absolute numbers don't match this guide, only the rules ordering matters. Firewall processing is ordered by lowest number to highest number.

Firewall policies are applied before SNAT (Source Network Address Translation) and after DNAT (Destination Network Address Translation).

The descriptions above are by no means exact regarding what is happening internally. These descriptions are just meant to convey enough information to help understand these firewall rules, their design, and their operation.

Additional References:

<https://help.ubnt.com/hc/en-us/articles/204976664-EdgeMAX-How-are-packets-processed-by-EdgeRouter>

You can issue a CLI command to view the firewall's connection table with:

```
sudo conntrack -L
```

---

## 48. Firewall State

There are many conditions available that can constitute a firewall rule. One of the most important conditions is “State.” States are maintained internally by the underlying firewall code that is within the EdgeRouter, and are:

- New** – a packet starting a new connection
- Invalid** – packets that have invalid data in them
- Established** – packets associated with an existing connection (conversation)
- Related** – packets related to an existing connection (conversation)

---

## 49. WAN Firewall Rules

The most important firewall rules in an EdgeRouter, from a security standpoint, are the default WAN\_IN and WAN\_LOCAL rulesets. These rulesets were generated by the WLAN+2LAN2 Wizard. The firewall rules with these rulesets provide the “firewall” protection associated with (consumer) Network Address Translation (NAT) routers. The WAN\_IN and WAN\_LOCAL rulesets are identical, except for naming, and for the interface that they are applied to. This is the WAN\_IN ruleset, from the backup file:

```
name WAN_IN {
    default-action drop
    description "WAN to internal"
    rule 10 {
        action accept
        description "Allow established/related"
        state {
            established enable
            related enable
        }
    }
    rule 20 {
        action drop
        description "Drop invalid state"
        state {
            invalid enable
        }
    }
}
```

The name of this ruleset is WAN\_IN. The rules in this ruleset are applied (not shown here) to the input side of the eth0 interface, i.e., to IP packets that are entering the EdgeRouter from the internet.

This ruleset has a default action of drop. If a packet destined for this interface doesn’t match any firewall rule, then the packet will be dropped.

The first rule (rule 10) in the ruleset has an action of “accept,” and will allow packets that are “established” and “related” (i.e. associated) to an existing IP conversation to enter eth0. The only way to have an existing connection on eth0 is for the connection to have been started from within the EdgeRouter’s system, i.e., from the EdgeRouter itself, or from a device on one of the EdgeRouter Networks. Note that there are no other / additional qualifiers on this rule(s), so it is applied to every IP packet entering from the internet.

The second rule (rule 20) has an action of “drop.” Any packet matching this rule: “invalid state” will be dropped.

## 50. EdgeRouter Detailed Firewall Setup

I have adapted Figure 83 – Layman’s Firewall Explanation Diagram to my own diagram. See Figure 84 – Detailed Firewall Setup Diagram.

The FireWall Rules (FWR) that are described in this guide are numbered (as FWR\*) in Figure 84 – Detailed Firewall Setup Diagram. Each is associated with a named firewall ruleset that will be described in the following sections. FWRs that are colored red means a ruleset terminates with a default of drop, while FWRs colored green mean a default of accept. The firewall rule sets are:

- FWR1 = WAN\_LOCAL.
- FWR2 = WAN\_IN.
- FWR3 = WIRED\_IOT\_LOCAL.
- FWR4 = WIRED\_SEPARATE\_LOCAL.
- FWR5 = WIRED\_SEPARATE\_IN.
- FWR6 = WIRED\_SEPARATE\_OUT.
- FWR7 = HOME\_OUT (same single set of rules, but shown in two places).
- FWR8 = WIFI\_GUEST\_LOCAL.
- FWR9 = WIFI\_IOT\_LOCAL.
- FWR10 = WIFI\_SPARE\_LOCAL (identical to FWR8, but not shown).

The descriptions below are by no means exact regarding what is happening internally. These descriptions are just meant to convey enough information to help understand these firewall rules, their design and their operation.

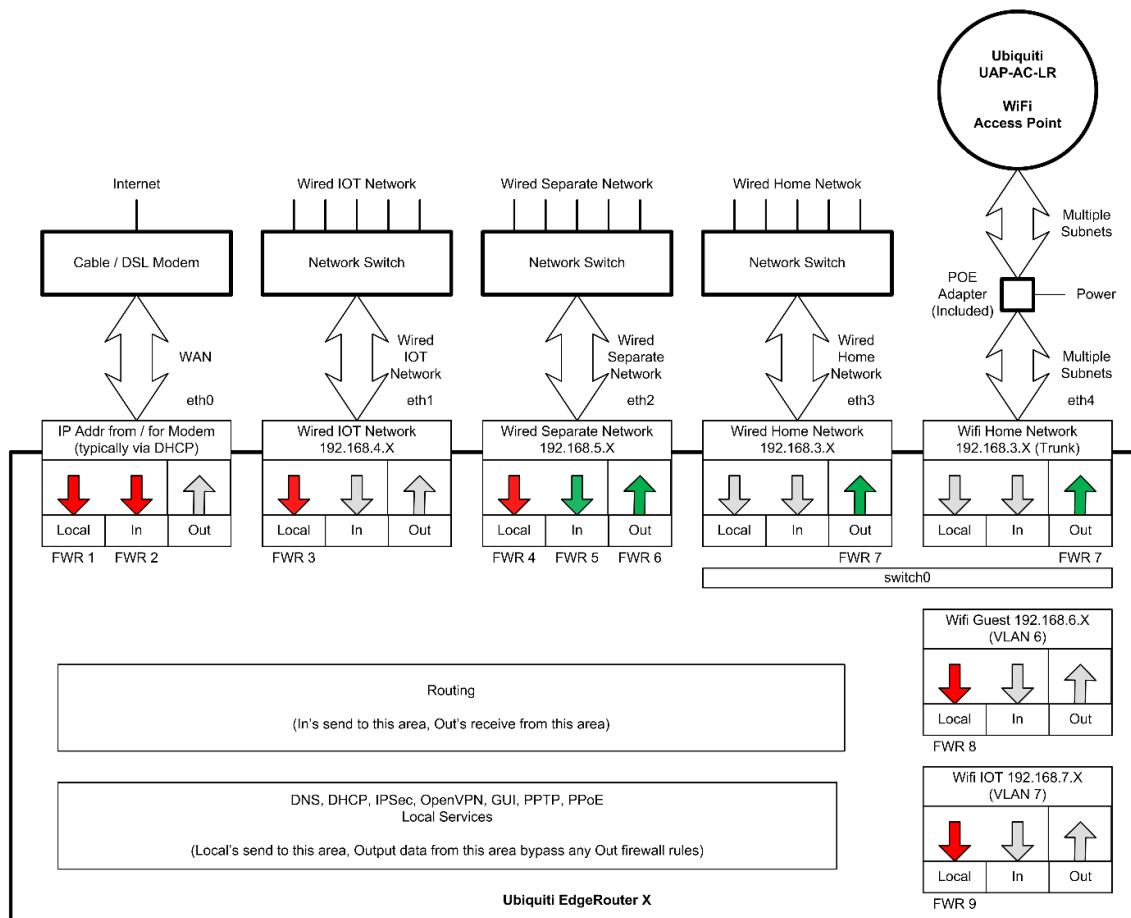

Figure 84 – Detailed Firewall Setup Diagram

---

## 51. WAN\_LOCAL Firewall Rules

The basic operation of these firewall rules is described above, in the section titled “49 - WAN Firewall Rules”. These rules are FRW1 as shown in Figure 84 – Detailed Firewall Setup Diagram.

---

## 52. WAN\_IN Firewall Rules

The basic operation of these firewall rules is described above, in the section titled “49 - WAN Firewall Rules”. These rules are FRW2 as shown in Figure 84 – Detailed Firewall Setup Diagram.

Add port forwarding, etc...

Debugging port forwarding:

<https://community.ui.com/questions/SOLVED-Port-forwarding-to-IP-camera/f3384ddf-c2f5-4619-ae4c-0042f7349928#answer/4b4fad3e-4e88-4f0a-b142-4cf5929f34f9>

---

## 53. HOME\_OUT Firewall Rules

There are five firewall rules in this ruleset. These firewall rules inspect IP packets that are exiting the EdgeRouter towards devices on the Home Network. Reference “FWR7,” shown as two instances, in the upper-right of Figure 84 – Detailed Firewall Setup Diagram.

These five rules are maintained as four accept rules (one rule per interface), followed by one general-purpose drop rule. Each interface is a separate Network. Except for naming and the Network that they are applied to, the accept rules are identical. The four Networks, which these are applied-to, are: Wired Iot Network, Wifi Iot Network, Wifi Guest Network, and Wifi Spare Network.

The following section of backup file will be referenced later, so it was given a reference tag of Equation 1 – A Portion of the HOME\_OUT Firewall Ruleset.

Note that when Ubiquiti uses the term “address-group” in a backup file, it can instead/also mean “Interface Network”.

This is a portion from the backup file:

```
name HOME_OUT {  
    default-action accept  
    description "Home Out"  
    rule 10 {  
        action accept  
        description "Allow Wired Iot Established Replies"  
        log disable  
        protocol all  
        source {  
            group {  
                address-group NETv4_eth1  
            }  
        }  
        state {  
            established enable  
            invalid disable  
            new disable  
            related enable  
        }  
    }  
    ...  
    rule 50 {  
        action drop  
        description "Drop RFC-1918 Traffic"  
        log disable  
        protocol all  
        source {  
            group {  
                address-group RFC-1918_GROUP  
            }  
        }  
    }  
}
```

**Equation 1 – A Portion of the HOME\_OUT Firewall Ruleset**

The name of this ruleset is HOME\_OUT. The rules in this ruleset are applied (not shown here) to the output side of both of the eth3 and eth4 interfaces, i.e., switch0. These interfaces are also known as the Home Network. IP packets that are exiting the EdgeRouter (on eth3/eth4) towards equipment on the Home Network are inspected and potentially dropped by these firewall rules. Remember that eth3 and eth4 are still bound together by the switch hardware within the EdgeRouter. In Figure 84 – Detailed Firewall Setup Diagram, this information is shown as duplicated in two blocks (in the upper-right portion of the diagram), each labeled with FWR7.

This ruleset has a default action of “accept.” If a packet destined for this interface doesn’t match any individual firewall rule, then the packet will be accepted, i.e., passed along to devices attached to the Home Network.

The first rule (rule 10) in this ruleset has an action of “accept,” and will allow IP packets that are “established” and “related” (i.e. associated) to an existing IP conversation, to exit the EdgeRouter to devices that are on the Home Network. Note that this rule has an additional qualifier that the source must be from eth1, i.e., this rule only applies to traffic that originates from the Wired IOT Network. The only way to have an existing connection between Wired IOT Network and the Home Network is for the conversation to have been started from devices within the Home Network. The name associated with this rule is "Allow Wired Iot Established Replies."

Rules 20, 30, and 40 are also “accept”, “established / related”, operate identical to Rule 10, but are applied to different Networks.

Rule 50 in this ruleset has an action of “drop,” and will drop all other IP packets that originate from any RFC-1918 address. This address set include all of the Networks used in this project. This is a change from earlier versions of this guide, as there was separate “drop” rule for each Network. Reference section 88 - Simple Service Discovery Protocol (SSDP) / igmp-proxy for what I found that slipped around the previous rules.

The two rules, number 10 and number 50, treated as a set, describe the IP connections (conversations) that can occur between equipment on the Wired IOT Network and the Home Network.

If the conversation was started by devices in the Home Network and directed to devices residing on the Wired IOT Network, then replies to those conversations will be allowed back into the Home Network by firewall rule number 10. Internally, the firewall code keeps track of IP connections, which are entering the EdgeRouter (the “In” side) and then allows traffic that is related to that data to exit the EdgeRouter towards the Home Network devices.

If a conversation was instead started by devices within the Wired IOT Network and directed towards the Home Network, firewall rule 10 will have no prior knowledge about this conversation (because it is not “established”/“related”). Therefore, firewall rule number 10 will not match, and firewall rule processing will then proceed to rule number 20. Rules number 20, 30, and 40 do not apply to traffic from the Wired IOT Network, so those rules do not apply, and no action is taken for them. When this traffic is inspected by rule number 50, this rules condition will match, and the “drop” action will be taken. This data will be discarded by the EdgeRouter, and will therefore NOT reach any device on the Home Network.

Remember that the default action for this ruleset is “accept.” You want the Home Network to be able to operate on its own, i.e. over the Internet, when it is not conversing with just these internal Networks.

Note that every IP packet attempting to exit the EdgeRouter towards devices on the Home Network will need to be inspected by these six firewall rules. Most of the traffic destined for the Home Network will not be from one of the IOT or Guest Networks.

Alternate firewall description:

<https://community.ui.com/questions/Sanity-check-for-WAN-Firewall-rules/e82408d3-e8c9-470c-a284-e28528678fde#answer/71475b15-8623-41f1-ab93-5e723018c1aa>

## 54. Firewall Conditions

The following figures are from the “Add New Rule” firewall dialog. We will explain how to get to these in the next section. There are several Tabs in this dialog for entering firewall conditions. You might want to study the following figures, and familiarize yourself with what firewall conditions are available. See the following figures:

Figure 85 – Firewall Conditions, Basic Tab.

Figure 86 – Firewall Conditions, Advanced Tab.

Figure 87 – Firewall Conditions, Source Tab.

Figure 88 – Firewall Conditions, Destination Tab.

Figure 89 – Firewall Conditions, Time Tab.

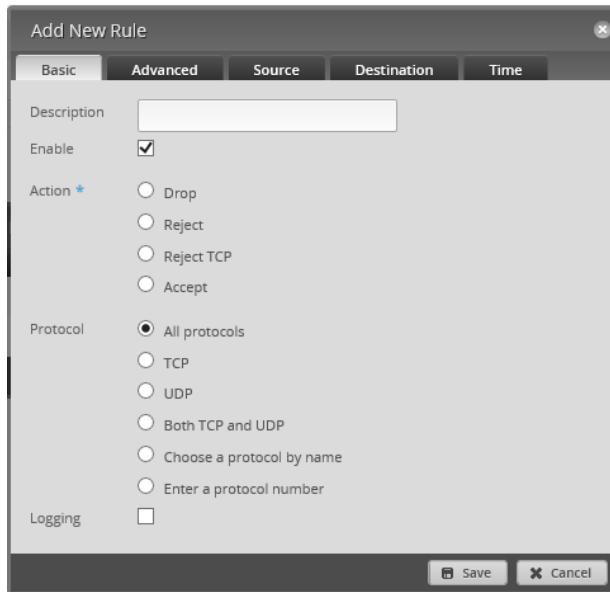

Figure 85 – Firewall Conditions, Basic Tab

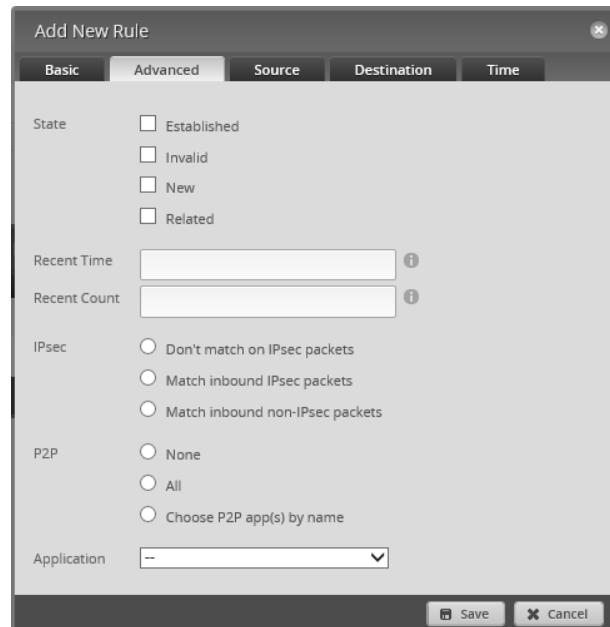

Figure 86 – Firewall Conditions, Advanced Tab

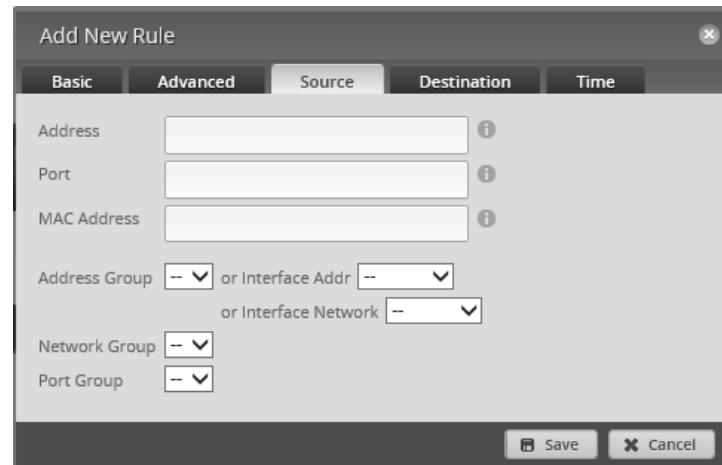

Figure 87 – Firewall Conditions, Source Tab

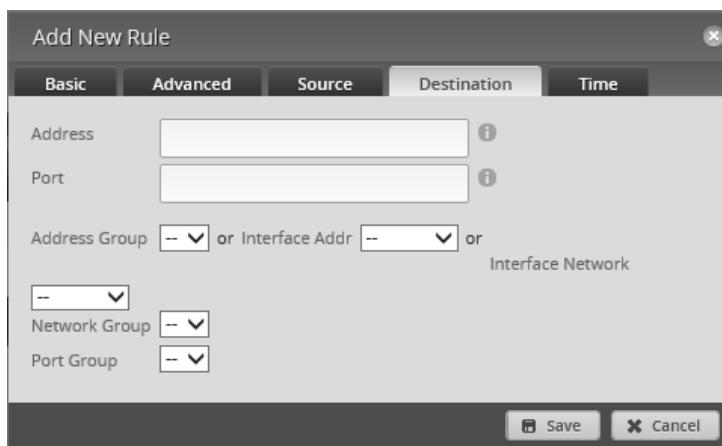

Figure 88 – Firewall Conditions, Destination Tab

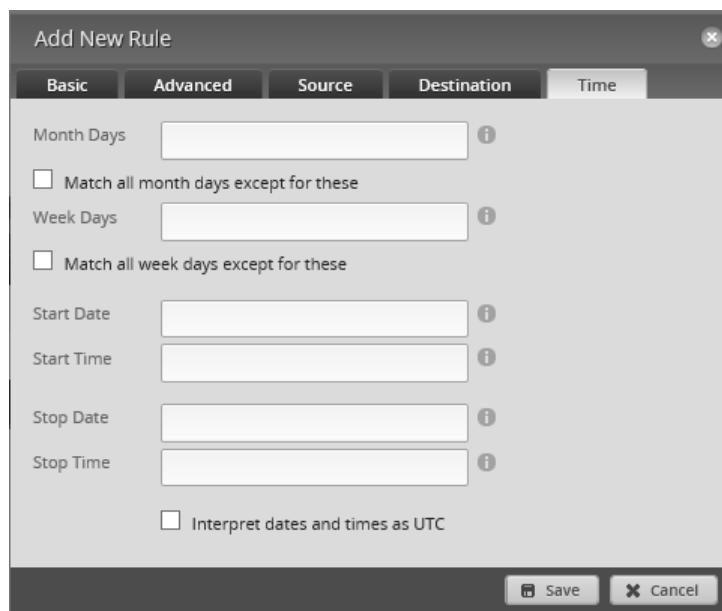

Figure 89 – Firewall Conditions, Time Tab

## 55. Adding Firewall Rules

Hopefully, you now understand the design of the HOME\_OUT firewall rules. Now it is time to actually add these rules. This section will use a portion of HOME\_OUT rules as an example of how to add firewall rules using the GUI interface.

While you are using the GUI to add these rules, please frequently reference the backup file segment labeled “Equation 1 – A Portion of the HOME\_OUT Firewall Rules”, which is in section “53 - HOME\_OUT Firewall Rules.” This should help you better relate between the two forms - that of the backup text description versus that of GUI entry.

Select the “Firewall/NAT” button from the top of the screen. Reference Figure 76 – Firewall/NAT Button.

Ensure that the “Firewall Policies” tab is selected. See Figure 90 – Firewall Policies Tab.

Figure 90 – Firewall Policies Tab

The two WAN rulesets, which were added by the Wizard, should be shown. Press the “+ Add Ruleset” button. See Figure 91 – Add Ruleset.

Name	Interfaces	Number of Rules	Default Action
WAN_IN	eth0/in	2	drop
WAN_LOCAL	eth0/local	2	drop

Showing 1 to 2 of 2 entries

Figure 91 – Add Ruleset

You will be presented with a “Create New firewall Ruleset.” See Figure 92 – Blank Create New Firewall Ruleset.

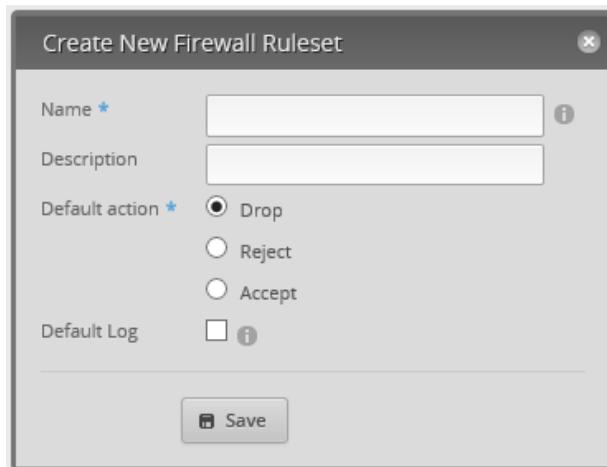

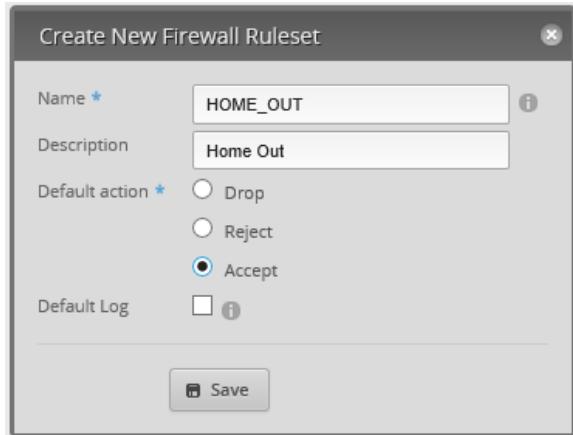

Figure 92 – Blank Create New Firewall Ruleset

Enter the following into the Create New Firewall Ruleset dialog:

Name	HOME_OUT
Description	Home Out
Default action	Accept

See Figure 93 – HOME\_OUT Example New Ruleset.

**Figure 93 – HOME\_OUT Example New Ruleset**

Press “Save.” A HOME\_OUT ruleset will be created. Note that no interfaces have been selected, and the number of rules is 0. See Figure 94 – Empty HOME\_OUT Ruleset.

Name	Interfaces	Number of Rules	Default Action
HOME_OUT		0	accept
WAN_IN	eth0/in	2	drop
WAN_LOCAL	eth0/local	2	drop

Showing 1 to 3 of 3 entries

**Figure 94 – Empty HOME\_OUT Ruleset.**

Find the “Actions” button at the right end of the HOME\_OUT line (not shown) and press it. You will be presented with a “Firewall Actions Menu.” See Figure 95 – Firewall Actions Menu.

**Figure 95 – Firewall Actions Menu**

Choose “Edit Ruleset.” A dialog for editing firewall rules appears. The “Rules” Tab should already be selected. See Figure 96 – Edit Ruleset Dialog.

Note that this dialog also contains Tabs of “Configuration,” “Interfaces,” and “Stats.” These match the handy shortcuts that are also in the previously shown Actions menu, reference Figure 95 – Firewall Actions Menu.

Figure 96 – Edit Ruleset Dialog

Choose the “Configuration” Tab. You should see the information that was entered earlier. See Figure 97 – Firewall Rule Configuration Tab.

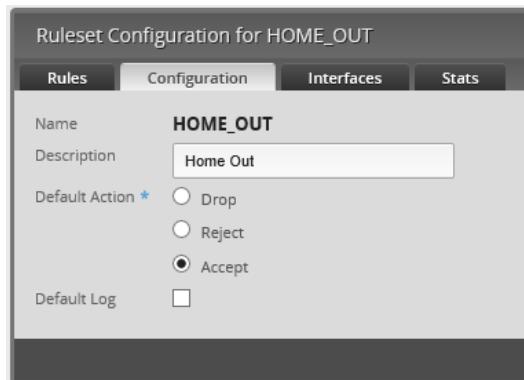

Figure 97 – Firewall Rule Configuration Tab

Choose the “Interfaces” Tab. Select the following information in the dialog:

Interface switch0  
Direction out

Then press the “Save Ruleset” button.

A lot of problems occur because a ruleset is created and the interface / direction is never set and/or saved.

Since the Home Network is governed by switch0 (i.e. switch0 contains interfaces of eth3 and eth4), we need to choose “switch0” for the Interface, not the individual eth3 or eth4. If an interface is not part of switch0 (eth0, eth1, or eth2) then we would just select that individual interface. See Figure 98 – Firewall Rule Interface Tab.

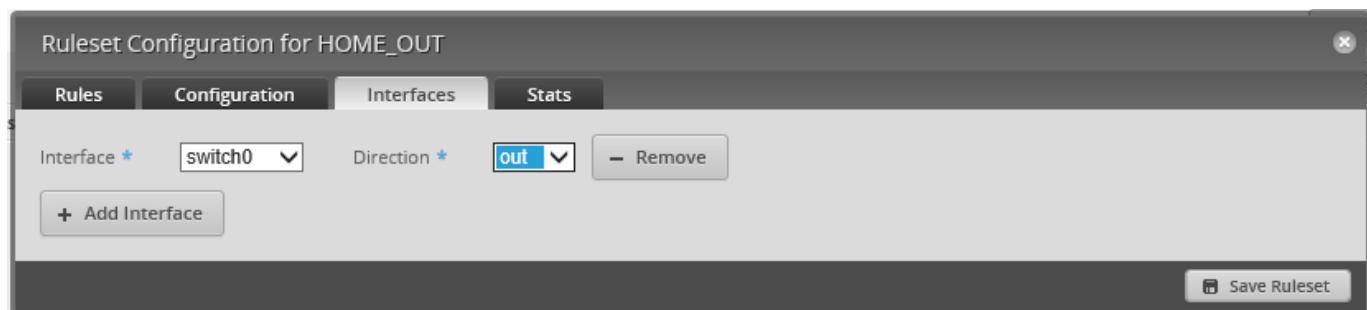

Figure 98 – Firewall Rule Interface Tab

Re-select the “Rules” Tab, and press the “Add New Rule” Button, that is shown in Figure 96 – Edit Ruleset Dialog. An “Add New Rule” dialog will be shown. See Figure 99 – HOME\_OUT Firewall, Rule1, Basic. Enter the following into the Basic Tab:

Description	Allow Wired IoT Replies
Enable	CHECKED
Action	Accept
Protocol	All protocols

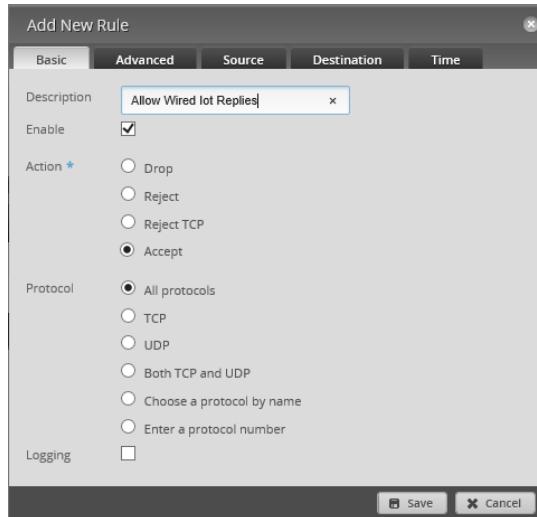

Figure 99 – HOME\_OUT Firewall, Rule1, Basic

Click on the Advanced Tab. See Figure 100 – HOME\_OUT Firewall, Rule1, Advanced. Enter the following information into the Advanced Tab:

State, Established	CHECKED
State, Invalid	Un-checked
State, New	Un-checked
State, Related	CHECKED

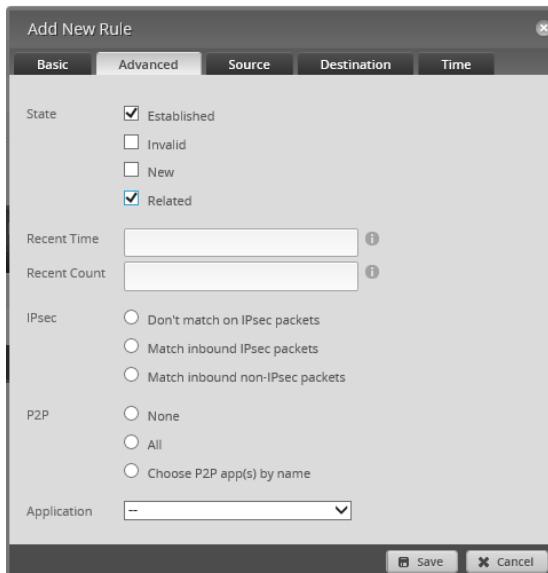

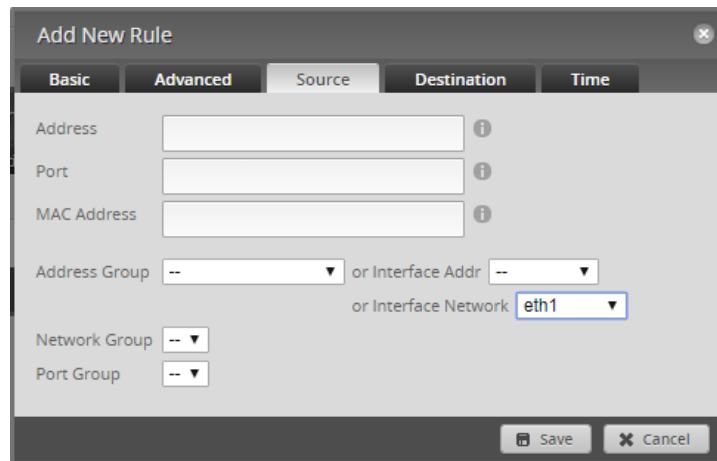

Figure 100 – HOME\_OUT Firewall, Rule1, Advanced

Click on the Source Tab. See Figure 101 – HOME\_OUT Firewall, Rule 1, Source. Select the following information for the Source Tab:

Interface Network      eth1

**Figure 101 – HOME\_OUT Firewall, Rule 1, Source**

Press the “Save” button.

Earlier versions of this guide used an “Address Group” instead of “Interface Network”. These two methods are equivalent, but there was more setup involved in using an “Address Group”. Reference

<https://community.ubnt.com/t5/EdgeRouter/Firewall-Interface-Addr-vs-Interface-Network/td-p/2238960>

You now have a new rule in the HOME\_OUT ruleset. See Figure 102 – HOME\_OUT Firewall, Rule 1. Note that you used an “Interface Network”, but “address-group” is instead/

still shown.

Ruleset Configuration for HOME_OUT						
Rules		Configuration	Interfaces	Stats		
Order	Description	Source	Destination	Protocol	Action	
1	Allow Wired IoT Replies	address-group NETV4_eth1		all	accept	<button>Actions ▾</button>
<button>Add New Rule</button>						<button>Save Rule Order</button>

**Figure 102 – HOME\_OUT Firewall, Rule 1**

---

## 56. Adding More HOME\_OUT Firewall Rules

We now need to add three more rules to the HOME\_OUT Ruleset. These rules have identical composition to the rule that was already added, only the names and sources are different. Using the steps that are shown in the above section “55 - Adding Firewall Rules”, add three more rules per the backup data that is shown below. Note that the following three instances of “address-group” really mean “Interface Group”. Reference Figure 101 – HOME\_OUT Firewall, Rule 1, Source.

```
rule 20 {
    action accept
    description "Allow Wifi Guest Established Replies"
    log disable
    protocol all
    source {
        group {
            address-group NETv4_switch0.6
        }
    }
    state {
        established enable
        invalid disable
        new disable
        related enable
    }
}

rule 30 {
    action accept
    description "Allow Wifi Iot Established Replies"
    log disable
    protocol all
    source {
        group {
            address-group NETv4_switch0.7
        }
    }
    state {
        established enable
        invalid disable
        new disable
        related enable
    }
}

rule 40 {
    action accept
    description "Allow Wifi Spare Established Replies"
    log disable
    protocol all
    source {
        group {
            address-group NETv4_switch0.8
        }
    }
    state {
        established enable
        invalid disable
        new disable
        related enable
    }
}
```

We now need to add the final “drop” rule to the HOME\_OUT Ruleset. This rule consists of:

- Basic Tab has an Action of “drop”.
- Advanced Tab has nothing selected (i.e. no state.)
- Source Tab uses a (really this time) Address Group of “RFC-1918 Group”.

Using the steps that are shown in the above section “55 - Adding Firewall Rules”, add the last rule per the following backup data that is shown below (which matches the above settings):

```
rule 50 {  
    action drop  
    description "Drop RFC-1918 Traffic"  
    log disable  
    protocol all  
    source {  
        group {  
            address-group RFC-1918_GROUP  
        }  
    }  
}
```

Here is a recap of how the HOME\_OUT ruleset works.

The first rule allows traffic that is “established” and “related” (i.e. associated) to go out FROM the EdgeRouter, towards devices on the Home Network that have a SOURCE address that matches (originated from) the Wired IOT Network. The association would be to traffic that previously went IN (towards the EdgeRouter) destined for the Wired IOT Network. This would typically be a request to a device on the Wired IOT Network from a device on the Home Network.

The last rule (which we just configured) drops all traffic from all the local Networks that was not matched by any of the established / related rules, i.e., any non-requested traffic that was initiated by a device on one of the non-home Networks.

The default action for the HOME\_OUT ruleset is “accept,” allowing traffic that is not SOURCED from the Wired IOT Network to pass OUT to devices on the Home Network. This would be traffic coming from the internet, or from the EdgeRouter itself.

Remember that the order of firewall rules really matters in what happens to traffic. The current HOME\_OUT rules are shown in Figure 103 – Firewall Ruleset Ordering

Ruleset Configuration for HOME_OUT					
Rules	Configuration	Interfaces	Stats		
Order	Description	Source	Destination	Protocol	Action
1	Allow Wired IoT Replies	address-group NETV4_eth1		all	accept
2	Allow WiFi Guest Established Replies	address-group NETV4_switch0.6		all	accept
3	Allow WiFi IoT Established Replies	address-group NETV4_switch0.7		all	accept
4	Allow WiFi Spare Established Replies	address-group NETV4_switch0.8		all	accept
5	Drop RFC-1918 Traffic	address-group RFC-1918_GROUP		all	drop

[Add New Rule](#) [Save Rule Order](#)

**Figure 103 – Firewall Ruleset Ordering**

To change the order of firewall rules, you simply drag a row up or down and let go. The numbers will change to show you what the order will be when you press the “Save Rule Order” button, which is in the lower right. To cancel a move, select the “X” in the upper right.

Drag the row “Allow WiFi IoT Established Replies” to the top of the entries, and let go of the mouse button. Your screen should look like Figure 104 – Firewall Ruleset New Order. Press “Save Rule Order” button.

I am doing this, as I expect there will be more replies from IoT equipment than replies from equipment on any other Network. This processing order should be more efficient.

Ruleset Configuration for HOME_OUT					
Rules	Configuration	Interfaces	Stats		
Order	Description	Source	Destination	Protocol	Action
2	Allow Wired IoT Replies	address-group NETV4_eth1		all	accept
3	Allow WiFi Guest Established Replies	address-group NETV4_switch0.6		all	accept
1	Allow WiFi IoT Established Replies	address-group NETV4_switch0.7		all	accept
4	Allow WiFi Spare Established Replies	address-group NETV4_switch0.8		all	accept
5	Drop RFC-1918 Traffic	address-group RFC-1918_GROUP		all	drop

[Add New Rule](#) [Save Rule Order](#)

**Figure 104 – Firewall Ruleset New Order**

---

## 57. WIRED\_IOT\_LOCAL, WIFI\_IOT\_LOCAL Firewall Rules

These rules are FWR3 and FWR9 as shown in Figure 84 – Detailed Firewall Setup Diagram.

The purpose of these rules is to block the use of EdgeRouter local services from these two IOT Networks, except for the use of DNS and the operation of DHCP.

The DHCP protocol uses a source UDP port of 68 and a destination UDP port of 67.

The DNS protocol uses port 53 of both TCP and UDP.

The DNS firewall rules for the Wired Iot and Wifi Iot Networks, presented below, contain an additional destination-address restriction. These DNS firewall rules will only accept DNS requests, which are issued to the Open DNS resolver addresses. DNS requests to other providers will be dropped via the ruleset's default drop rule.

Note that the destination addresses specified here (via the OPENDNS\_SERVERS\_GROUP) must match the Wired Iot and Wifi Iot Network's DHCP entered DNS1 and DNS2 addresses. Reference section 30 - Add DHCP Servers to the VLANs and section 32 - Modify EdgeRouter's eth1 DHCP Server. It's not good to tell your Iot devices to use one set of DNS provider addresses (via DHCP) and then drop those requests when your firewall rules only accept addresses of a different DHCP provider.

We now need to add two more rulesets, with each ruleset containing two firewall rules. Using the steps that are shown in the above section “55 - Adding Firewall Rules”, add the following two rulesets, each containing two firewall rules, with a real address-group, per the backup data that is shown below:

When adding the following WIRED\_IOT\_LOCAL ruleset, remember to also set and SAVE the following:

```
Interface:      eth1
Direction:     local

name WIRED_IOT_LOCAL {
    default-action drop
    description "Wired Iot Local"
    rule 1 {
        action accept
        description "Allow DHCP"
        destination {
            port 67
        }
        log disable
        protocol udp
        source {
            port 68
        }
    }
    rule 2 {
        action accept
        description "Allow Only OpenDNS"
        destination {
            group {
                address-group OPENDNS_SERVERS_GROUP
            }
            port 53
        }
        log disable
        protocol tcp_udp
    }
}
```

When adding the DNS rule, the above “tcp\_udp” description is shown in the GUI as “Both TCP and UDP.”

Note that there is an “Actions” / “Copy Ruleset” available, that can be used to clone an existing ruleset.

When adding the following WIFI\_IOT\_LOCAL ruleset, remember to also set and SAVE the following:

```
Interface:      switch0.7
Direction:     local

name WIFI_IOT_LOCAL {
    default-action drop
    description "WiFi Iot Local"
    rule 1 {
        action accept
        description "Allow DHCP"
        destination {
            port 67
        }
        log disable
        protocol udp
        source {
            port 68
        }
    }
    rule 2 {
        action accept
        description "Allow Only OpenDNS"
        destination {
            group {
                address-group OPENDNS_SERVERS_GROUP
            }
            port 53
        }
        log disable
        protocol tcp_udp
    }
}
```

When adding the DNS rule, the above “tcp\_udp” description is shown in the GUI as “Both TCP and UDP.”

---

## 58. WIFI\_GUEST\_LOCAL Firewall Rules

These rules are FWR8 as shown in Figure 84 – Detailed Firewall Setup Diagram.

The purpose of these rules is to block the use of EdgeRouter local services from the Wi-Fi Guest Network, except for the use of DNS and the operation of DHCP.

To add the following ruleset and rules, follow what was done in the above section “55 - Adding Firewall Rules”.

Note that we are not dropping DNS requests based upon which DNS provider address(es) your guests may be using in their devices. Most people’s devices are probably configured just to use the providers’ (provided via DHCP) DNS resolvers addresses. If a guest hardcoded the DNS resolver addresses within their device AND we only accepted DNS requests going to specific DNS resolvers, then we could have just denied our guests service on our network.

When adding the following WIFI\_GUEST\_LOCAL ruleset, remember to also set and SAVE the following:

Interface: switch0.6  
Direction: local

```
name WIFI_GUEST_LOCAL {  
    default-action drop  
    description "Wifi Guest Local"  
    rule 1 {  
        action accept  
        description "Allow DHCP"  
        destination {  
            port 67  
        }  
        log disable  
        protocol udp  
        source {  
            port 68  
        }  
    }  
    rule 2 {  
        action accept  
        description "Allow DNS"  
        destination {  
            port 53  
        }  
        log disable  
        protocol tcp_udp  
    }  
}
```

---

## 59. WIFI\_SPARE\_LOCAL Firewall Rules

These rules are designated as FWR10 but are not shown in Figure 84 – Detailed Firewall Setup Diagram. You can instead look at the similar FWR8.

The purpose of these rules is to block the use of EdgeRouter local services from the Wi-Fi Spare Network, except for the use of DNS and the operation of DHCP.

To add the following ruleset and rules, follow what was done in the above section “55 - Adding Firewall Rules”.

When adding the following WIFI\_SPARE\_LOCAL ruleset, remember to also set and SAVE the following:

```
Interface:      switch0.8
Direction:      local

name WIFI_SPARE_LOCAL {
    default-action drop
    description "WiFi Spare Local"
    rule 1 {
        action accept
        description "Allow DHCP"
        destination {
            port 67
        }
        log disable
        protocol udp
        source {
            port 68
        }
    }
    rule 2 {
        action accept
        description "Allow Only OpenDNS"
        destination {
            group {
                address-group OPENDNS_SERVERS_GROUP
            }
            port 53
        }
        log disable
        protocol tcp_udp
    }
}
```

---

## 60. Optional DNS Forcing of the WIFI\_GUEST\_LOCAL Network

Performing the steps within this section is optional. This forcing of DNS is really NOT needed, but was a good exercise in learning how NAT rules operate.

The destination Network Address Translation (NAT) rules, presented here, will force any devices on the guest Network to only be able to use Open DNS resolvers. This is regardless of if the devices specify their own DNS resolver addresses and ignore the DNS resolver addresses suggested by the EdgeRouter's guest DHCP server.

The two rules presented here work with each other. Rule #1 will exclude NAT from being performed on DNS requests directed towards either of the OpenDNS resolver addresses. These two addresses are in an address group. This allows both the primary and secondary resolver addresses to pass-through the EdgeRouter from the Guest Network. Rule #2 will act upon any remaining port 53 (DNS) requests (that did not match Rule #1) from the Guest network, and translate the associated IP address into the address of the primary OpenDNS resolver.

Press the Firewall/NAT button near the top of the screen. Reference Figure 76 – Firewall/NAT Button.

Ensure that the NAT tab is selected and then press the “+ Add Destination NAT Rule” button. See Figure 105 – NAT Tab.

Port Forwarding		Firewall Policies		NAT	Firewall/NAT Groups	
+ Add Source NAT Rule		Save Rule Order				
<hr/>						
Order	▲	Description	▼	Source	▼	Destination
1		masquerade for WAN				
<hr/>						
Showing 1 to 1 of 1 entries						
+ Add Destination NAT Rule		Save Rule Order				
Order	▲	Description	▼	Source	▼	Destination
No rules available.						

**Figure 105 – NAT Tab**

You will be presented with a “Destination NAT Rule Configuration” dialog.

Enter the data for NAT rule #1, as follows:

Description	Exclude OpenDNS Wifi Guest
Enable	CHECKED
Inbound Interface	switch0.6
Translations, Port	53
Exclude From NAT	CHECKED
Protocol	Both TCP and UDP
Dest Port	53
Dest Address Group	OpenDNS Servers

and save it. See Figure 106 – NAT Rule Number 1.

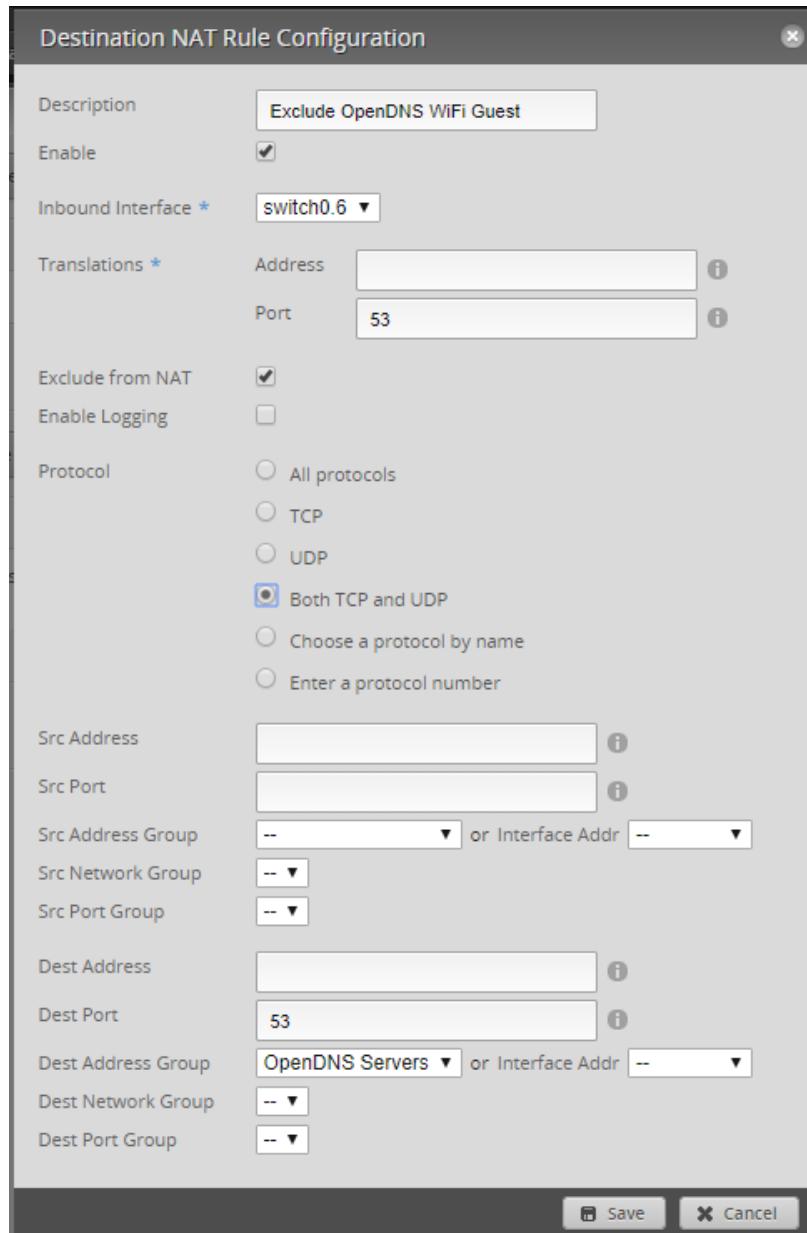

Figure 106 – NAT Rule Number 1

Press the “+ Add Destination NAT Rule” button and enter the data for NAT rule #2, as follows:

Description	Force OpenDNS WiFi Guest
Enable	CHECKED
Inbound Interface	switch0.6
Translations, Address	208.67.222.222
Exclude From NAT	Un-Checked
Protocol	Both TCP and UDP
Dest Port	53

and save it. See Figure 107 – NAT Rule Number 2.

Destination NAT Rule Configuration

Dest Port Group	--

Save     Cancel

Figure 107 – NAT Rule Number 2

This is the relevant portion from the backup file. Rule 5010 is an existing Source NAT rule for handling the WAN port (eth0).

```
nat {
    rule 1 {
        description "Exclude OpenDNS WiFi Guest"
        destination {
            group {
                address-group OPENDNS_SERVERS_GROUP
            }
            port 53
        }
        exclude
        inbound-interface switch0.6
        inside-address {
            port 53
        }
        log disable
        protocol tcp_udp
        type destination
    }
    rule 2 {
        description "Force OpenDNS WiFi Guest"
        destination {
            port 53
        }
        inbound-interface switch0.6
        inside-address {
            address 208.67.222.222
        }
        log disable
        protocol tcp_udp
        type destination
    }
    rule 5010 {
        description "masquerade for WAN"
        outbound-interface eth0
        type masquerade
    }
}
```

These rules can be tested, if you are implementing this DNS forcing using actual OpenDNS resolvers. This is because OpenDNS has a test page:

<http://welcome.opendns.com>

that can show if you are using OpenDNS as a resolver.

To perform this test, first temporarily change the DNS resolvers associated with the Guest Network's DHCP server (switch0.6) to something else. I used addresses of 8.8.8.8 and 8.8.4.4 from Google. Reference section 30 - Add DHCP Servers to the VLANs. Then, using a device attached to the Guest Network, visit the OpenDNS test page. If you get their success page, then these two rules translated the Google DNS addresses into OpenDNS addresses. You may have to reboot the EdgeRouter and/or the Guest device to ensure that the changed DNS resolver addresses propagated to the Guest device. Remember to return the Guest Network's DNS resolver addresses (in the DHCP area) back to the OpenDNS addresses.

Reference this OpenDNS page about testing:

<https://support.opendns.com/hc/en-us/articles/227986567-How-to-Test-for-Successful-OpenDNS-Configuration->

---

## 61. WIRED\_SEPARATE Firewall Rules

The Wired Separate Network is meant to be kept separate from the other Networks, i.e., not allow communications with anyone except with the Internet.

There are two usage scenarios, which I can think of, for the Separate Network.

1. You might want to put your banking computer on this Separate Network.  
In this instance, people and devices on the other Networks cannot get to your banking computer.
2. You might want to provide internet access to the friend's kid (i.e.tenant) who lives in your basement.  
In this instance, you don't want any people or devices on the Separate Network  
to be able to access any of your other Networks, OR be able to access the internals of the EdgeRouter.

I'm thinking that eth2 needs to be removed from the ER-X's switch to ensure that tagged VLAN data does not leak out the eth2 port from the switch usage.

Reference Figure 84 – Detailed Firewall Setup Diagram, for FWR numbers and Network routing / interactions

Reference Table 1 - Table of Networks, for Network subnet addresses

To block instance number 1, we need to block traffic from exiting OUT of the EdgeRouter that was initiated from another Network / subnet, and then allow other traffic (from the Internet.)

To add the following ruleset and rules, follow what was done in the above section “55 - Adding Firewall Rules”.

When adding the following WIRED\_SEPARATE\_OUT ruleset, remember to also set and SAVE the following:

```
Interface:      eth2
Direction:      out

name WIRED_SEPARATE_OUT {
    default-action accept
    description "Wired Separate Out"
    rule 1 {
        action drop
        description "Drop Non-Separate Traffic"
        log disable
        protocol all
        source {
            group {
                address-group RFC-1918_GROUP
            }
        }
    }
}
```

To block the first part of instance number 2, we need to block traffic from entering IN the EdgeRouter and going to devices that are on any of the other Networks. This ruleset will be labeled WIRED\_SEPARATE\_IN and is denoted as FWR5.

When adding the following WIRED\_SEPARATE\_IN ruleset, remember to also set and SAVE the following:

```
Interface:      eth2
Direction:     in

name WIRED_SEPARATE_IN {
    default-action accept
    description "Wired Separate In"
    rule 1 {
        action drop
        description "Block RFC-1918 Traffic"
        destination {
            group {
                address-group RFC-1918_GROUP
            }
        }
        log disable
        protocol all
    }
}
```

To block the second part of instance number 2, we need to block traffic from entering the EdgeRouter itself (LOCAL) except for DNS and DHCP requests. This ruleset will be labeled WIRED\_SEPARATE\_LOCAL and is denoted as FWR4.

When adding the following WIRED\_SEPARATE\_LOCAL ruleset, remember to also set and SAVE the following:

```
Interface:      eth2
Direction:     local

name WIRED_SEPARATE_LOCAL {
    default-action drop
    description "Wired Separate Local"
    rule 1 {
        action accept
        description "Allow DHCP"
        destination {
            port 67
        }
        log disable
        protocol udp
        source {
            port 68
        }
    }
    rule 2 {
        action accept
        description "Allow DNS"
        destination {
            port 53
        }
        log disable
        protocol tcp_udp
    }
}
```

---

## 62. EdgeMax Change Interface Names

Press the Dashboard Button. Reference Figure 35 – Dashboard Button.

Find the line with an Interface of “switch0”. Click on the Action button to the right of this line. Select “Config” from the Actions Menu. You will see a dialog similar to Figure 38 – switch0 Configuration. Change the Description field to “Home Net.”

Repeat these steps for the following Interfaces as shown in Table 4 - Table of Interface Names:  
(You have just done the last one)

Interface	Description
eth1	Wired lot Net
eth2	Wired Separate Net
eth3	Home Net
eth4	Home Net
switch0	Home Net

**Table 4 - Table of Interface Names**

---

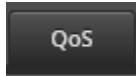

## 63. SmartQueue Setup

This section is optional. Turning on SmartQueue (on your WAN port) can help solve the issue of “bufferbloat”. Reference the internet for “bufferbloat” if you are unfamiliar with it. Smart Queue is a variety of Quality of Service (QoS.) Enabling QoS may disable the hardware acceleration that was enabled in section 35 - EdgeRouter Enable HW NAT Assist. I think that if you only enable QoS on the WAN port, that HW acceleration will stay enabled.

One place to test connection speeds (and bufferbloat), to see if you should setup QoS, is:

<http://www.dslreports.com/speedtest>

To enable SmartQueue, press the QoS button, located near the top of the page. See Figure 108 – QoS button.

**Figure 108 – QoS button**

Ensure that the Smart Queue tab is selected. You may not need to press the “+ Add Smart Queue” button.

QOS needs to know your maximum upload rate and/or your maximum download rate to be able to manage the data. Since we will be selecting eth0, which is your WAN, you can run a speedtest to acquire these numbers. From what I understand, QOS kicks-in when you reach (approximately 90% to 95% of) these maximum rates. This means that you lose about 10% of your internet bandwidth when enabling QOS. If you make the number(s) too high, then QoS will not take effect, and you lose the benefit of having QOS. If you make the number(s) too low, then you are throwing away more bandwidth.

There are also posting / indications that you should only implement SmartQueue in the Upload direction. My (example) connection speeds are 26 down and about 5 up, so that is what I show here.

To enable QOS on your WAN connection:

Choose a Policy name, like “Internet QOS”.

Choose WAN Interface of eth0.

Check “Apply to upload traffic”.

Enter your own upload speed (probably Mbits/sec) into the Upload Rate box.

Press Apply.

If Download filtering is desired:

Check “Apply to download traffic”.

Enter your own download speed (probably Mbits/sec) into the Download Rate box.

Press Apply.

If Download filtering is NOT desired:

Ensure “Apply to download traffic” is UnChecked.

Optionally, you can check “Show advanced options”. I know nothing about these options.

See Figure 109 – Example SmartQueue Settings

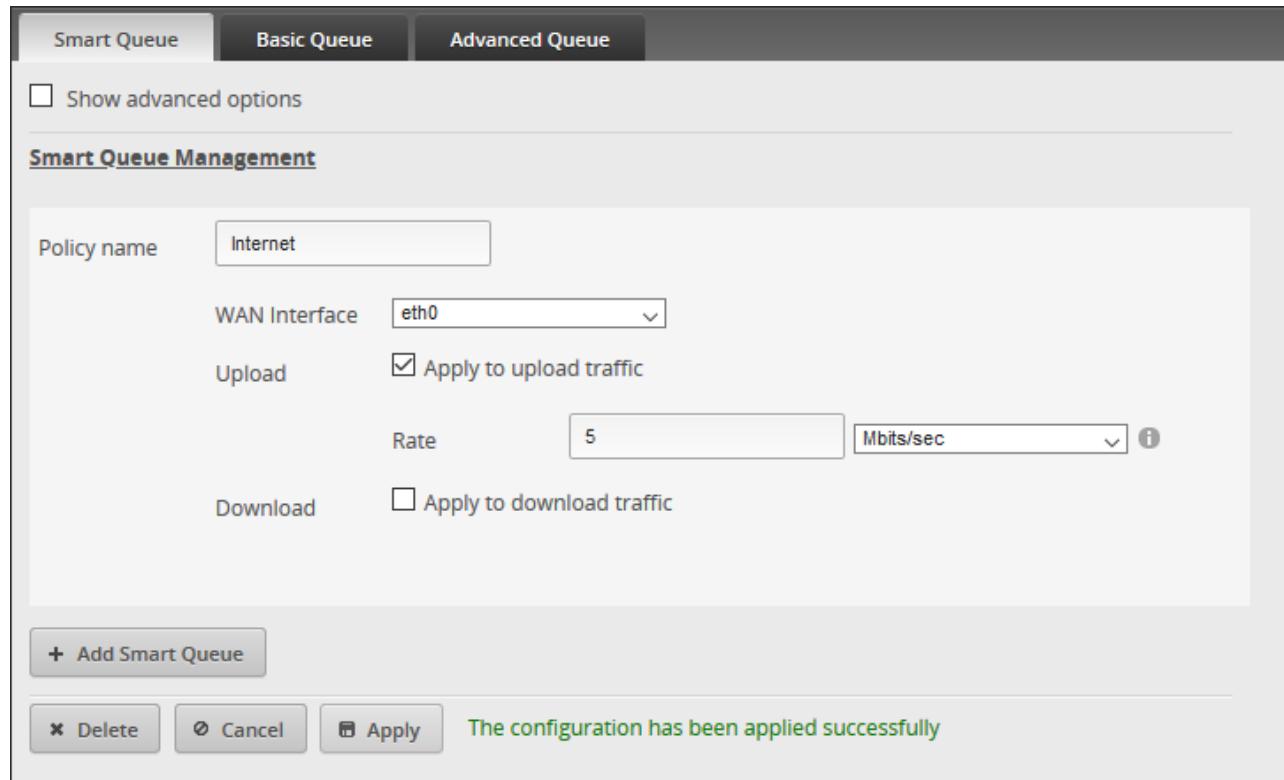

Figure 109 – Example SmartQueue Settings

Gaming QoS for League of Legends:

<https://community.ui.com/questions/Gaming-QoS-for-League-of-Legends-LoL/32392060-627f-40cc-9d48-32d1113ebd44>

This is the end of the ER-X BASIC setup. There are additional / optional ER-X setup steps later.

---

## 64. Ubiquiti AP-AC-LR Access Point Setup

This guide utilized Access Point software (UniFi) installed on a Windows PC. This software ONLY needs to be running when you are adopting or making configuration changes to your Access Point(s). The software does NOT need to be running all the time, unless you want the optional guest portal / data-collection features. These features might be found in a Motel/Hotel WiFi system, or a school building / library.

Other Ubiquiti Access points should work; the Ubiquiti AP-AC-LR model is just the model that I purchased.

I would never install this software on a PC again, because it requires buggy Java. There are also clients available for Linux, Macs, Android phones and Apple phones. I have heard that the phone Apps are rather limited. Ubiquiti makes a dedicated device called a Cloud-Key (version 1) which runs this software. Pricing seems about \$100. If you can afford it, this is well worth the hassle of loading Java on your PC. If you are very cost sensitive, loading software on your PC is free.

I purchased a Cloud-Key and am currently using it. Having this device saves the hassle of installing the UniFi (and insecure Java) software on a PC. The configuration steps look the same / similar. I only power-up this device when I need to make a configuration change to an Access Point. It is important that this device not have power cut unexpectedly.

You can also install the UniFi software onto a Raspberry Pi. This is more cost effective than purchasing a Cloud-Key. If I was starting over, today, I would use this solution. In fact, I have now installed UniFi, onto a Raspberry Pi, from the following link, just to try it. I loaded the following onto an RPi, then took a Cloud-Key backup image and restored the backup to the Rpi installation. It found my Access Point(s) and worked just fine.

I may call all of these items (that run UniFi code) a generic name of Cloud-Key within this guide.

If you are going to re-purpose a consumer router as an access point, instead of using an Ubiquiti Access Point, remember that some of the Network security is achieved via VLANS and Guest options within the Access Point. Firewall rules within the EdgeRouter may need to be adjusted, probably additional Guest Control Post-Authorization Restrictions. See near Figure 143 –Unifi Guest Control.

I suggest acquiring a real Access Point.

This is the Raspberry Pi installation I tried (I have not gotten to the Pi-Hole portion, yet):

<https://community.ui.com/questions/Step-By-Step-Tutorial-Guide-Raspberry-Pi-with-UniFi-Controller-and-Pi-hole-from-scratch-headless/e8a24143-bfb8-4a61-973d-0b55320101dc>

For completeness and caching, here is the main command to run on a Raspberry Pi:  
(Check the above link for updates, and this is a single, very long line)

```
wget "https://github.com/SmokingCrop/UniFi/raw/master/install-unifi-pihole-English.sh" -O install-unifi-pihole.sh && chmod +x install-unifi-pihole.sh && ./install-unifi-pihole.sh no-pihole
```

You may need to wait a couple of minutes (after rebooting the RPi) for the software to finish starting.  
Access the UniFi software by issuing “<https://localhost:8443>” into an RPi hosted web browser, or substitute the Raspberry Pi’s IP address for localhost, when accessing from an external browser.

Here are some other links:

<https://pimylifeup.com/raspberry-pi-unifi/>

<https://dougrathbone.com/blog/2018/03/31/configuring-a-ubiquiti-unifi-controller-to-run-on-raspberry-pi>

## 65. Hookup the Ubiquiti AP-AC-LR Access Point

Using two standard Ethernet cables:

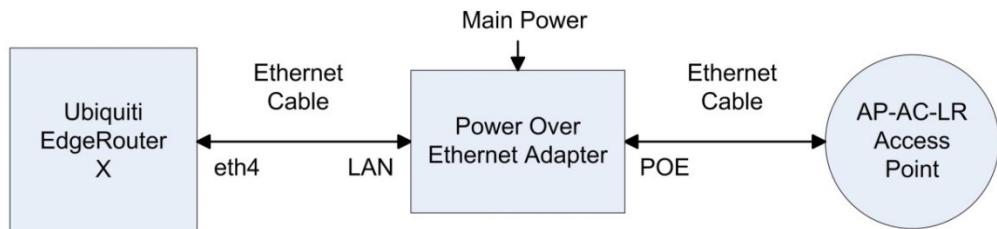

Wire the EdgeRouter's eth4 port to the LAN port of the included Power-Over-Ethernet (POE) Adapter.

Wire the POE port of the POE adapter to the Ethernet port on the Ubiquiti AP-AC-LR Access Point.

See Figure 110 – Typical Access Point Wiring.

Plug the POE adapter into your main electrical power.

**WARNING:** Connecting the POE port of the POE adapter to any other device will probably burn-up that other device.

**Figure 110 – Typical Access Point Wiring**

You can also have the POE adapter powering both the ER-X and the AP-AC-LR Access point. I am not powering my devices that way, as some people have reported instability. There is also the possibility of forgetting that eth4 is POE enabled, and plugging in some other equipment and burning it up. I keep the POE adapter next to the Access Point. There appears to be both 12W (24V \* 0.5A) and 24W (24V \* 1A) POE varieties. Other models of Access Points may-be / are powered differently and/or use different voltages, so use caution.

**References** (also see parent discussions):

<https://community.ui.com/questions/PoE-does-not-work-on-ER-X-with-AP-AC-LR/165d1a73-1dff-467c-9c70-9efc8085d9ed#answer/2ea39394-72de-4955-a174-d1943fc428fa>

## 66. Download and Install the Access Point Software

[The UniFi screenshots, in the following sections, were taken over several years, across several different UniFi versions and also from different platforms. I now suggest installing UniFi on a Raspberry Pi. You should still be able to follow along and get your Access Point(s) configured from what is here. Raspberry Pi users should be able to jump to section 68 - Initial Setup of the UniFi Software. Now back to the legacy directions.]

For Windows users, you will need to be an Administrator, or the installation will install (somewhere else) in the area belonging to the admin's account that was used.

Browse to:

<https://www.ubnt.com/download/unifi/>

Under the SOFTWARE section, download the NEWEST “UniFi Controller for Windows” software (UniFi-installer.exe). When this guide was written, it was version 5.4.11.

Under the DOCUMENTATION section, you might also want to download:

UniFi Controller v5 Users Guide (or later version)  
UniFi AC-LR-AP Quick Start Guide.

**The following install items may be slightly out of order between your installation and that of this guide. I had to re-start my UniFi Setup.** You might also reference <https://github.com/mjp66/Ubiquiti/issues/7>

Run the UniFi-installer.exe. Acknowledge any Windows admin prompts. See Figure 111 – UniFi Setup Welcome Screen.

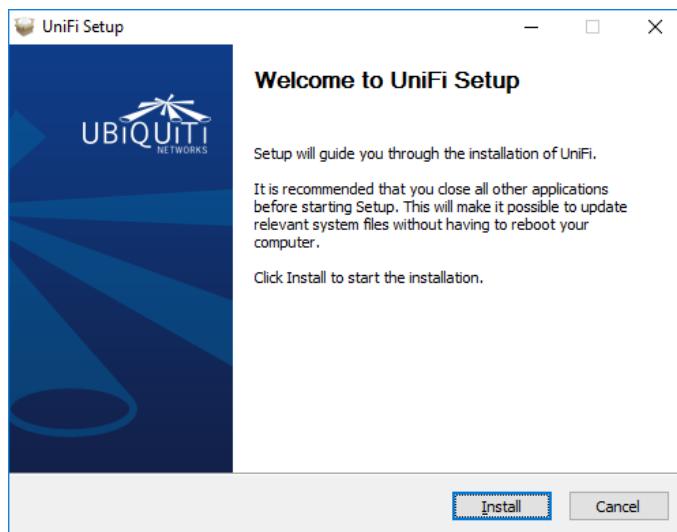

Figure 111 – UniFi Setup Welcome Screen

If Java is not installed on your PC, you will be prompted to install Java. See Figure 112 – UniFi Java Required. Click “OK”.

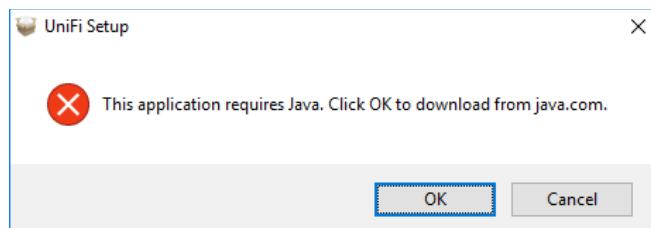

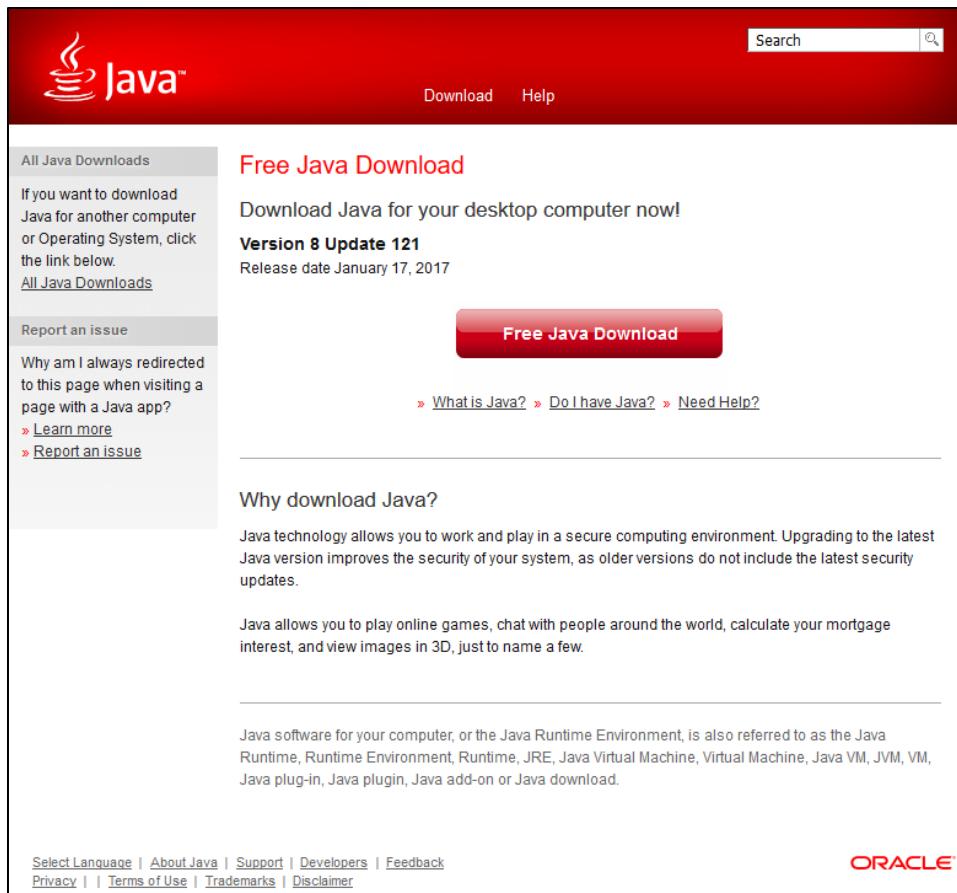

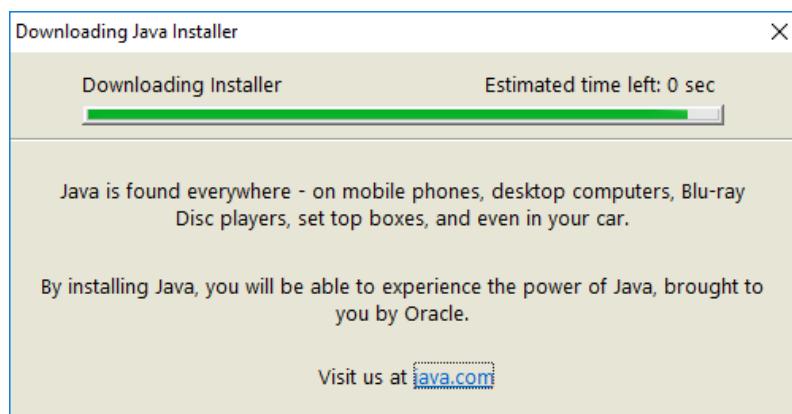

Figure 112 – UniFi Java Required

You will be taken to an Oracle site to download Java. Click on the “Free Java Download” button. See Figure 113 – UniFi Download Oracle Java. Note that Oracle asks “Why download Java?” My only answer is “Because I have to”.

**Figure 113 – UniFi Download Oracle Java**

While downloading, Oracle will inform you that their security holes are found everywhere, and that you can experience that also. See Figure 114 – UniFi Downloading Oracle Java.

**Figure 114 – UniFi Downloading Oracle Java**

When done downloading, they will try and monetize you by setting up crapware. Select “Do not update browser settings”, unless you like this type of stuff. See Figure 115 – UniFi Oracle Crapware.

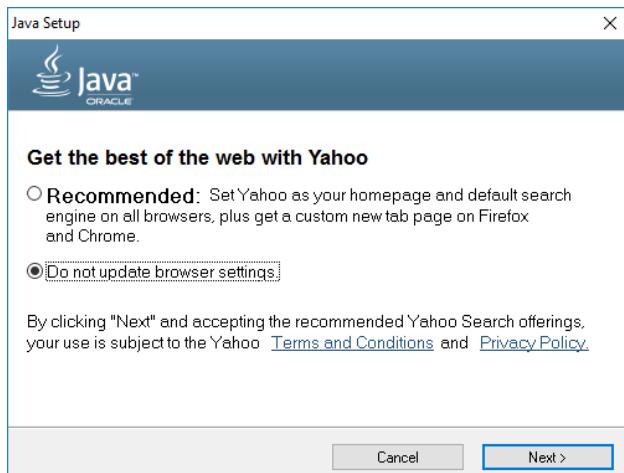

Figure 115 – UniFi Oracle Crapware

Run the downloaded JavaSetup\*.exe executable. Java will install. Oracle will again inform you that they are probably responsible for hundreds of billions of accumulated security holes, with billions of them in internet connected devices that will never be patched. See Figure 116 –UniFi Java Installing.

When Java is done installing you will see the dialog of See Figure 117 – UniFi Java Done. Press “Close”. When the next browser window opened (to verify Java is working), I closed that browser verify page.

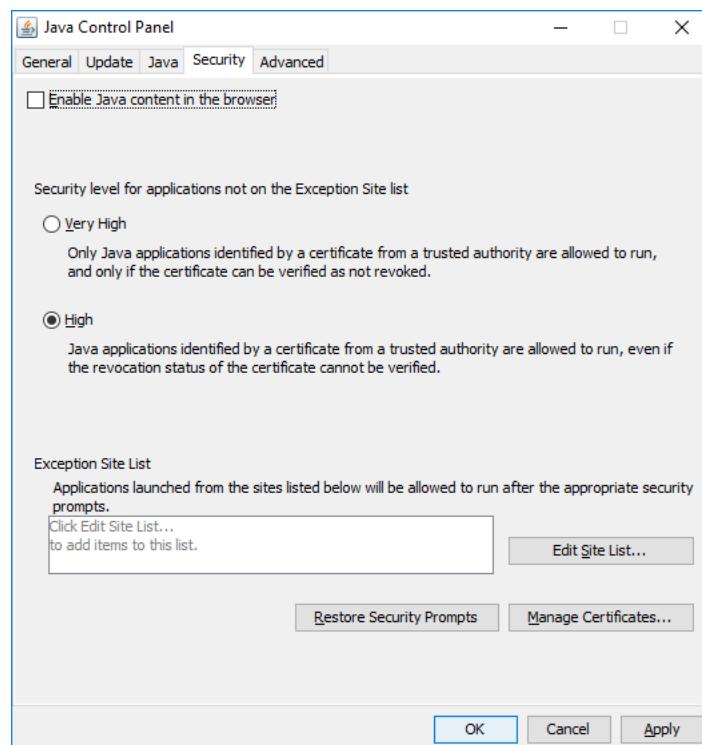

Figure 116 –UniFi Java Installing

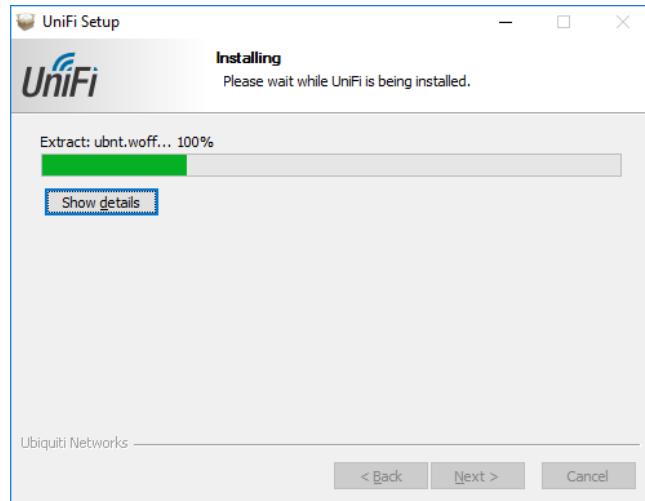

Figure 117 – UniFi Java Done

Press the Windows Start button; Go to the list of programs, select Java, then select “Configure Java”. Press the “Security” tab, and UNCHECK the “Enable Java content in the browser” checkbox. See Figure 118 – UniFi Java Control Panel. Without this you will be live-bait for any drive-by browsing malware.

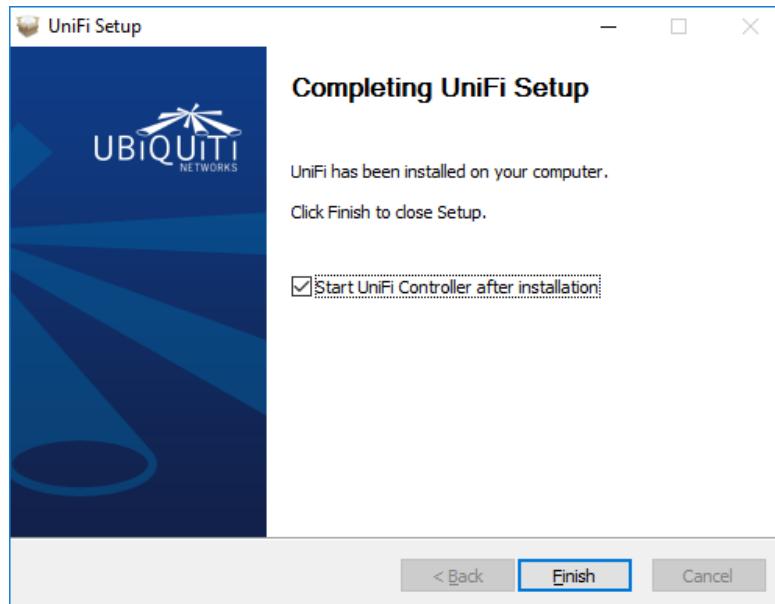

**Figure 118 – UniFi Java Control Panel**

I had to restart the UniFi installer. See Figure 119 – UniFi Installing.

**Figure 119 – UniFi Installing**

The UniFi software will finish installing. See Figure 120 – UniFi Done Installing

**Figure 120 – UniFi Done Installing**

---

## 67. Running the UniFi Software

Double click the Unifi icon on your desktop. See Figure 121 – UniFi Icon

**Figure 121 – UniFi Icon**

The UniFi controlling software will start to initialize. See Figure 122 – UniFi Controller Software Initializing.

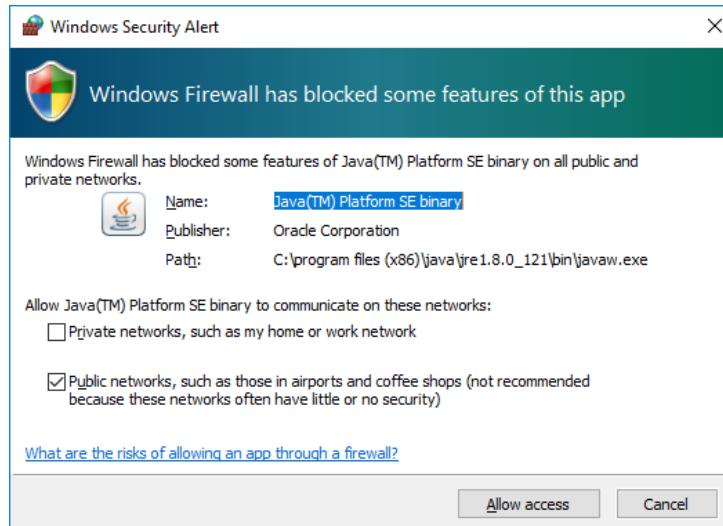

**Figure 122 – UniFi Controller Software Initializing**

When it has fully started, it will look like Figure 123 – UniFi Controller Software Running.

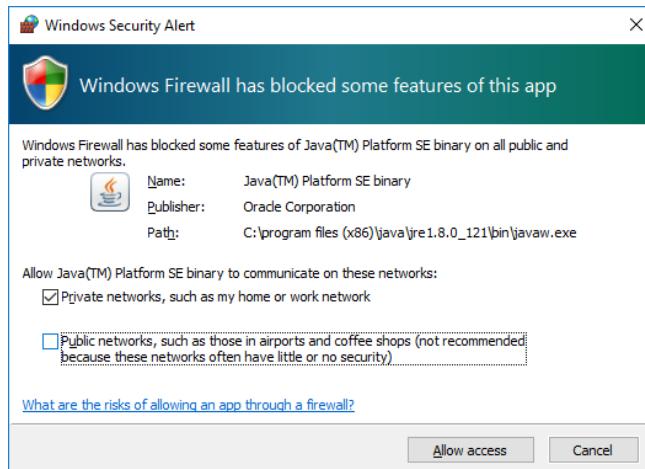

**Figure 123 – UniFi Controller Software Running**

When the UniFi Software started for the first time, a Windows Firewall dialog popped up. See Figure 124 – Windows Initial Firewall - UniFi.

**Figure 124 – Windows Initial Firewall - UniFi**

The wording and default selections seem backwards to me. I reversed the selections and pressed “Allow access”. See Figure 125 – Windows My Firewall Settings - UniFi.

**Figure 125 – Windows My Firewall Settings - UniFi**

**QUESTION:** Which settings are correct for keeping Java to only my local / private network?

## 68. Initial Setup of the UniFi Software

Either press the “Launch a Browser to Manage the Network” button or enter:

<https://localhost:8443/manage>      OR      <https://localhost:8443/>

into your browser. If accessing externally, substitute an IP address for localhost.

Most of the following screenshots are portions of the full browser screen.

Select your country, time zone, and enable Auto Backup”, then press Next. See Figure 126 – UniFi Setup Wizard.

The screenshot shows the UniFi Setup Wizard interface. At the top, it says "UniFi Setup Wizard". Below that, a message reads: "Thank you for purchasing UniFi, Ubiquiti's Enterprise WiFi Solution. You will be able to setup your controller in a few minutes." There are two dropdown menus: "Select your country" set to "United States" and "Select your timezone" set to "(UTC-05:00) Eastern Time (US & Canada)". Below these is a switch labeled "Enable Auto Backup" which is turned "ON". A link "Alternatively you can [restore from a previous backup](#)." is present. At the bottom right is a blue "NEXT" button.

**Figure 126 – UniFi Setup Wizard**

Your Ubiquiti Access Point should show up in the list. Check it and then press Next. See Figure 127 – UniFi Configure Devices.

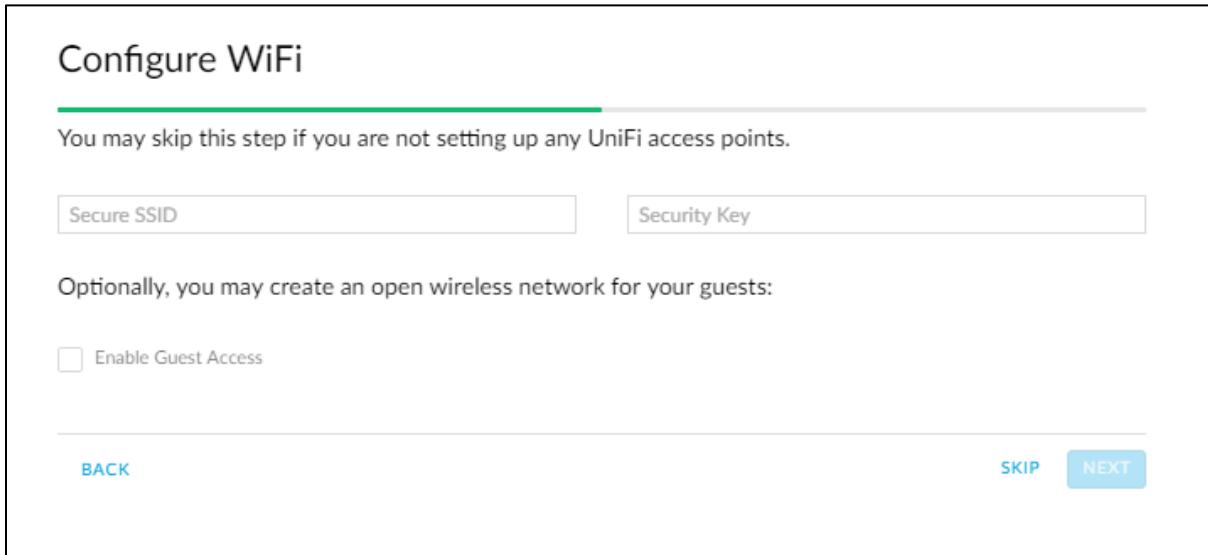

The screenshot shows the "Configure devices" page. It has a header "Configure devices" and a sub-instruction "Please select the devices you would like to configure.". Below is a table with the following data:

<input type="checkbox"/>	DEVICE NAME	MODEL	IP ADDRESS	UPTIME ↓
<input checked="" type="checkbox"/>	80:2a:a8:90:6c:8c	UniFi AP-AC-LR	192.168.3.48	1h 7m 25s

Below the table, it says "Showing 1-1 of 1 records. Items per page: 10". At the bottom are "BACK" and "NEXT" buttons.

**Figure 127 – UniFi Configure Devices**

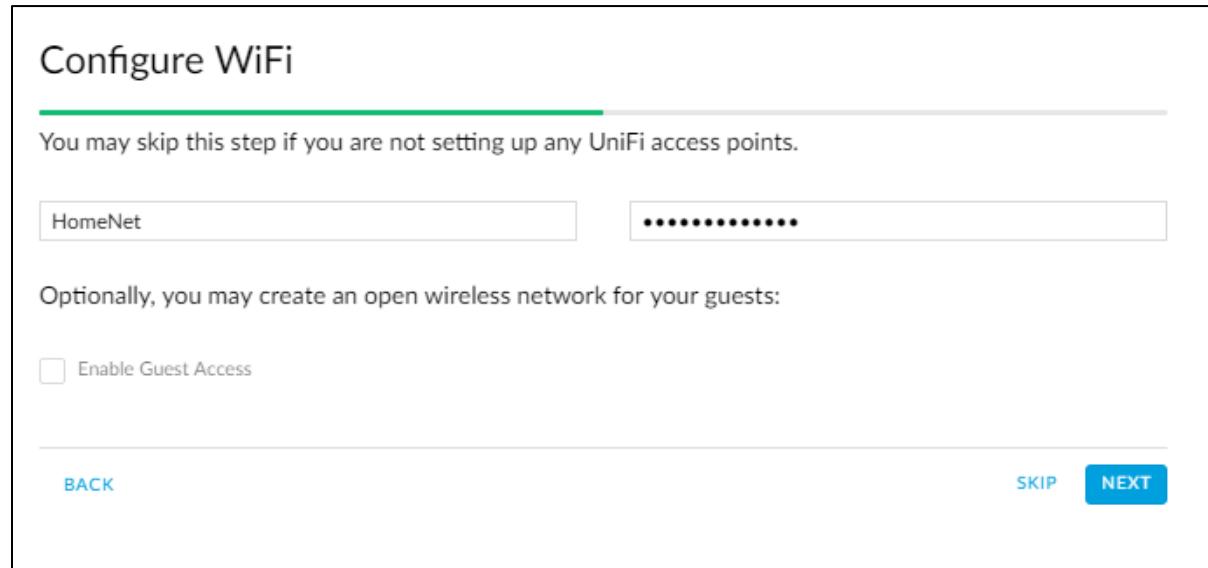

You will see the initial configure WiFi screen. See Figure 128 – UniFi Initial Configure WiFi.

The screenshot shows the 'Configure WiFi' step of a UniFi setup wizard. At the top, it says 'Configure WiFi'. Below that, a note says 'You may skip this step if you are not setting up any UniFi access points.' There are two input fields: 'Secure SSID' containing 'HomeNet' and 'Security Key' containing a series of asterisks ('\*\*\*\*\*'). A checkbox labeled 'Enable Guest Access' is unchecked. At the bottom, there are 'BACK', 'SKIP', and 'NEXT' buttons.

**Figure 128 – UniFi Initial Configure WiFi**

Fill in your main network's SSID and your WiFi password. I used the name "HomeNet" for this guide. This is the WiFi network that most of your computers, tablets, and cell phones will connect to. Leave the Enable Guest Network as UNCHECKED, and then press Next. See Figure 129 – UniFi Configure Wifi SSID.

This screenshot shows the 'Configure WiFi' step again. It has the same layout as Figure 128, but the 'Secure SSID' field now contains 'HomeNet' and the 'Security Key' field contains a series of asterisks ('\*\*\*\*\*'). The 'Enable Guest Access' checkbox is still unchecked. The 'BACK', 'SKIP', and 'NEXT' buttons are at the bottom.

**Figure 129 – UniFi Configure Wifi SSID**

To access this UniFi software later on, fill in the following information:

Admin Name  
Admin Email  
Password

You will want to write these down and/or put them in your password safe. The email address is used for password recovery. When finished, press Next. See Figure 130 – UniFi Controller Access.

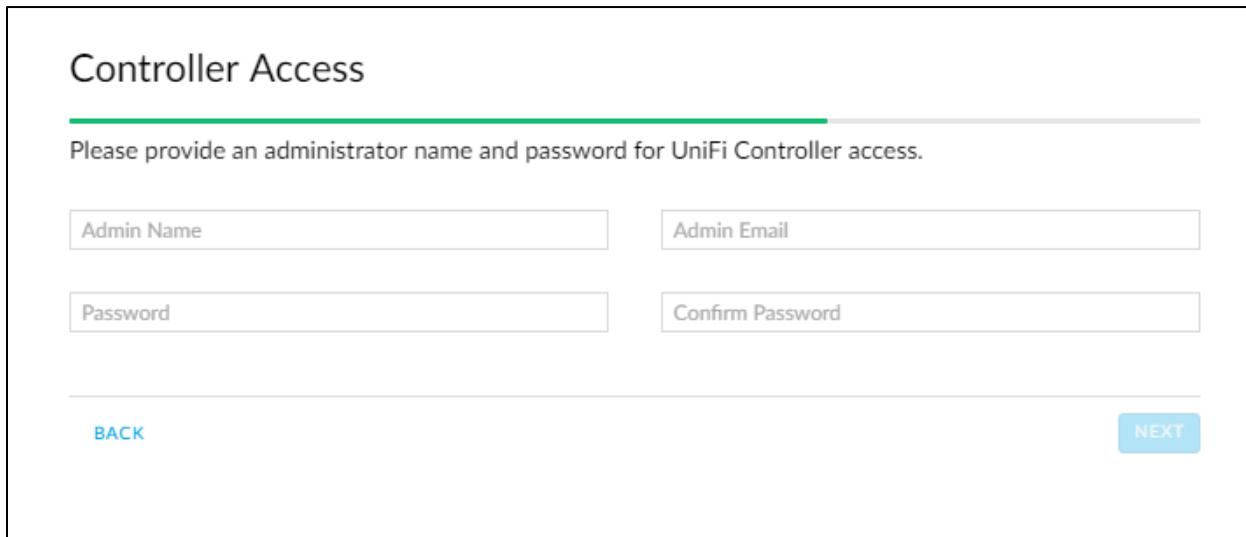

## Controller Access

Please provide an administrator name and password for UniFi Controller access.

Admin Name     Admin Email

Password     Confirm Password

[BACK](#)    [NEXT](#)

**Figure 130 – UniFi Controller Access**

Since I am not using Cloud Access, I pressed Skip. See Figure 131 – UniFi Cloud Access.

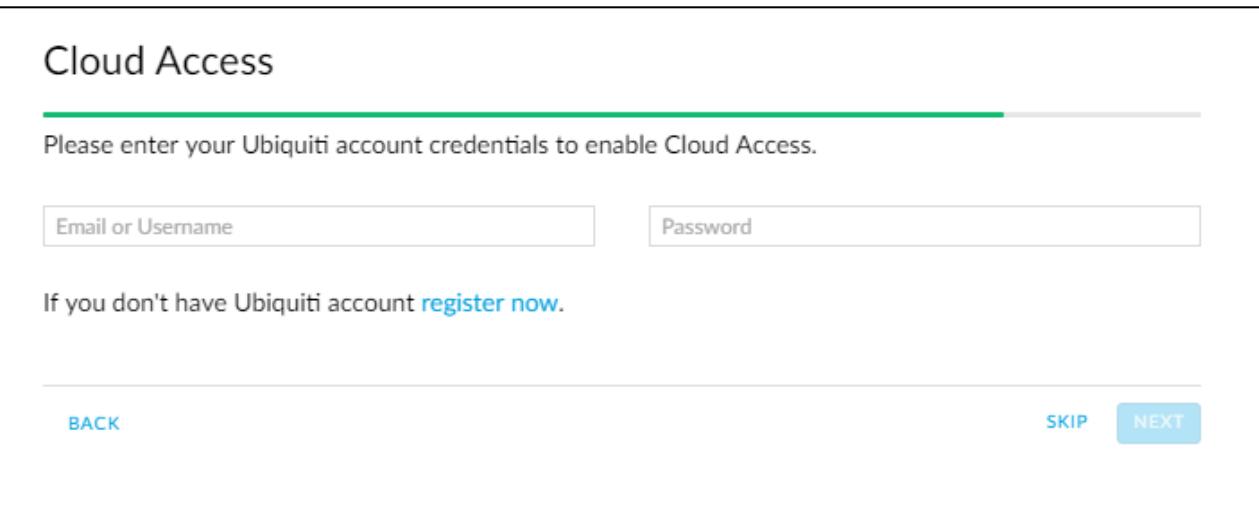

## Cloud Access

Please enter your Ubiquiti account credentials to enable Cloud Access.

Email or Username     Password

If you don't have Ubiquiti account [register now](#).

[BACK](#)    [SKIP](#)    [NEXT](#)

**Figure 131 – UniFi Cloud Access**

You are then asked to confirm the above information. If it is correct, press Finish. See Figure 132 – UniFi Confirm Setup.

## Confirm

Please review the settings below. Once finished you will be redirected to the management interface.

Country	United States
Timezone	America/New_York
Secure SSID	HomeNet
Guest SSID	-
Admin Name	Admin

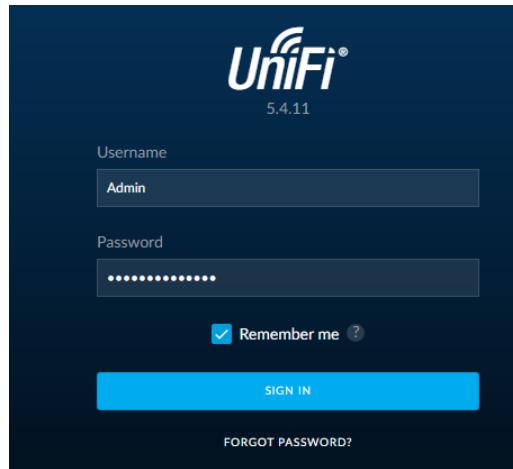

[BACK](#) [FINISH](#)

**Figure 132 – UniFi Confirm Setup**

---

## 69. Login to the UniFi Software

You will be asked to login to the UniFi Software. See Figure 133 – UniFi Login. Use your newly created credentials that were entered at Figure 130 – UniFi Controller Access.

**Figure 133 – UniFi Login**

You will land on the Dashboard page. See Figure 134 – Initial UniFi Dashboard Page

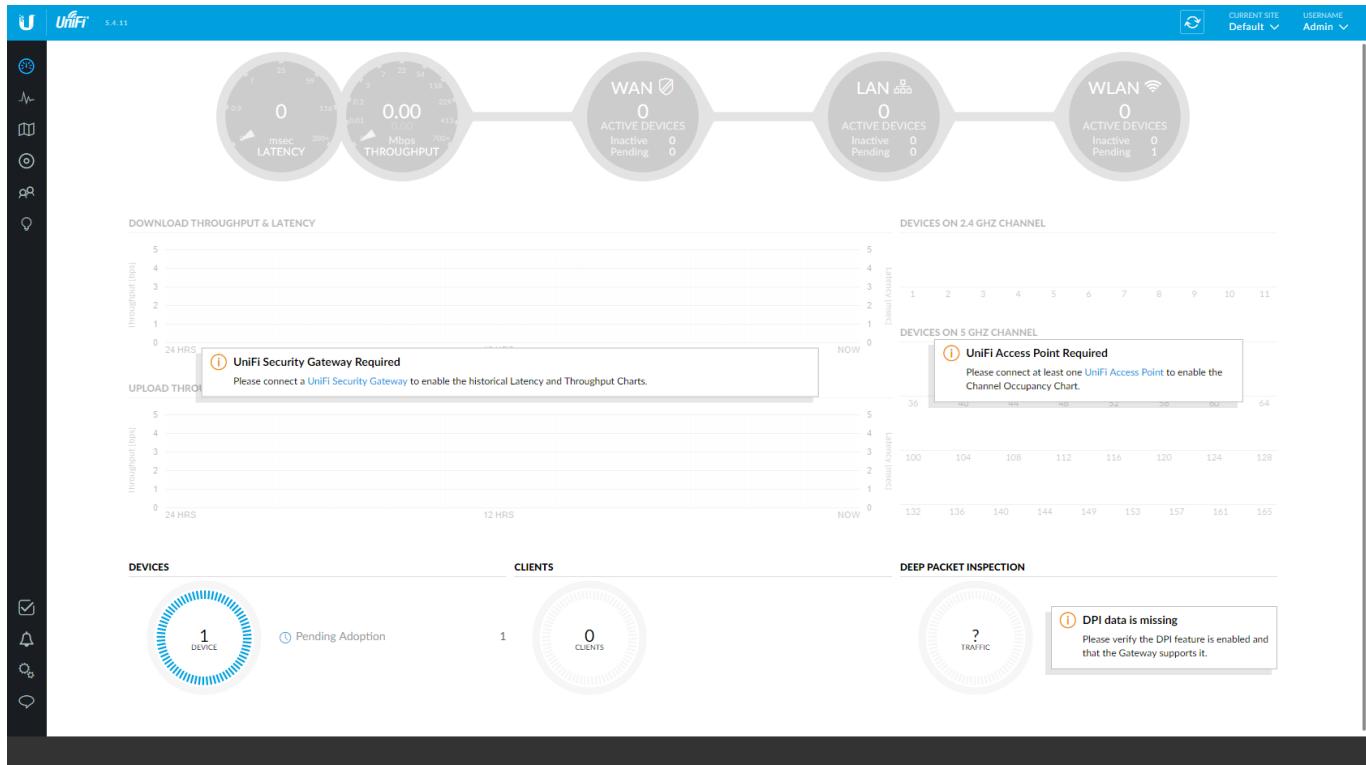

Figure 134 – Initial UniFi Dashboard Page

From the upper left hand side choose Devices. See Figure 135 – UniFi Devices Button.

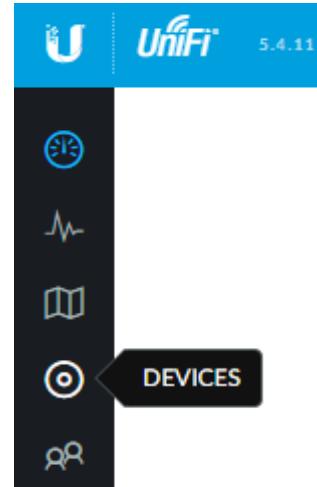

Figure 135 – UniFi Devices Button

## 70. UniFi Devices

You will see the devices page, and the Access Point should be Pending Adoption. See Figure 136 – Initial UniFi Device Screen. Note that this screenshot / figure was cut into two pieces and folded into one image.

The screenshot shows the UniFi Device screen with the following details:

- Header:** UniFi 5.4.11
- Device List:** ALL (1) GATEWAY/SWITCHES (0) APS (1) PHONES (0)
- Table Headers:** DEVICE NAME, IP ADDRESS, STATUS
- Table Data:** One row for device 80:2a:a8:90:6c:8c with IP 192.168.3.48 and STATUS PENDING ADOPTION.
- Page Navigation:** Showing 1-1 of 1 records, Items per page: 50
- User Information:** CURRENT SITE Default, USERNAME Admin
- Search Bar:** Search
- Table Headers (Bottom):** MODEL, VERSION, UPTIME, ACTIONS
- Table Data (Bottom):** UniFi AP-AC-LR, 3.4.14.3413, 1h 27m 46s, Actions: ADOPT, UPGRADE

Figure 136 – Initial UniFi Device Screen

Press the Upgrade button on the right side of the device line. Reference Figure 136 – Initial UniFi Device Screen. You will be presented with an upgrade confirmation dialog. Press Confirm. See Figure 137 – UniFi - Upgrade Access Point

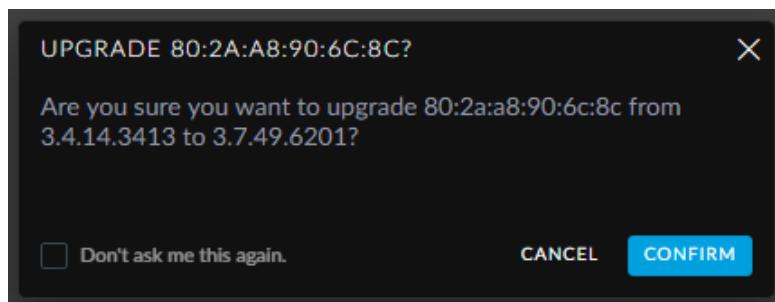

Figure 137 – UniFi - Upgrade Access Point

You should see acknowledgement of the upgrade. See Figure 138 – UniFi – Upgrading.

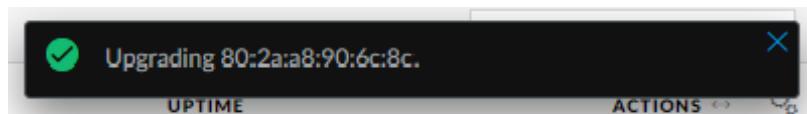

Figure 138 – UniFi – Upgrading Access Point

When the upgrade is finished, press the Adopt button on the right side of the device line. Reference Figure 136 – Initial UniFi Device Screen. You should see acknowledgement of the Adoption. See Figure 139 – UniFi – Adopting.

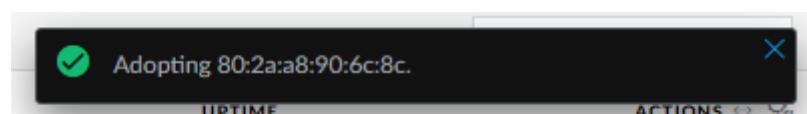

Figure 139 – UniFi – Adopting Access Point

Your device should now say Connected. The buttons on the right now allow you to locate, restart, and upgrade the Access Point. See Figure 140 – UniFi Access Point Connected. Note that this screenshot / figure was cut into two pieces and folded into one image.

The screenshot shows the UniFi Network interface. At the top, there's a navigation bar with icons for Overview, Devices, Reports, and Help, followed by the 'UniFi' logo and '5.4.11'. Below the navigation bar is a search bar with placeholder text 'Search' and a magnifying glass icon. To the right of the search bar are buttons for 'CURRENT SITE Default' and 'USERNAME Admin'. On the left, there's a sidebar with icons for Overview, Devices, Reports, and Help. The main content area displays a table of devices. The first row of the table has a 'SELECT' column, 'DEVICE NAME' (80:2a:a8:90:6c:8c), 'IP ADDRESS' (192.168.3.48), 'STATUS' (CONNECTED), and 'MODEL' (UniFi AP-AC-LR). Below this row, a message says 'Showing 1-1 of 1 records. Items per page: 50'. The table has a header row with columns 'MODEL', 'VERSION', 'UPTIME', 'ACTIONS', and a refresh icon. Under the 'ACTIONS' column, there are buttons for 'LOCATE', 'RESTART', and 'UPGRADE'. The bottom of the table shows the details for the single record: UniFi AP-AC-LR, Version 3.4.14.3413, Uptime 1h 41m 37s.

Figure 140 – UniFi Access Point Connected

Find the Settings button, near the lower left side of the screen, and press it. See Figure 141 – Settings Button

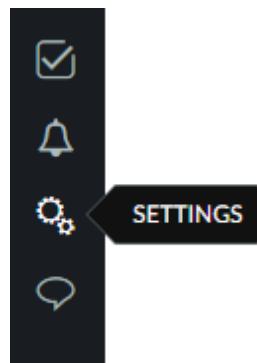

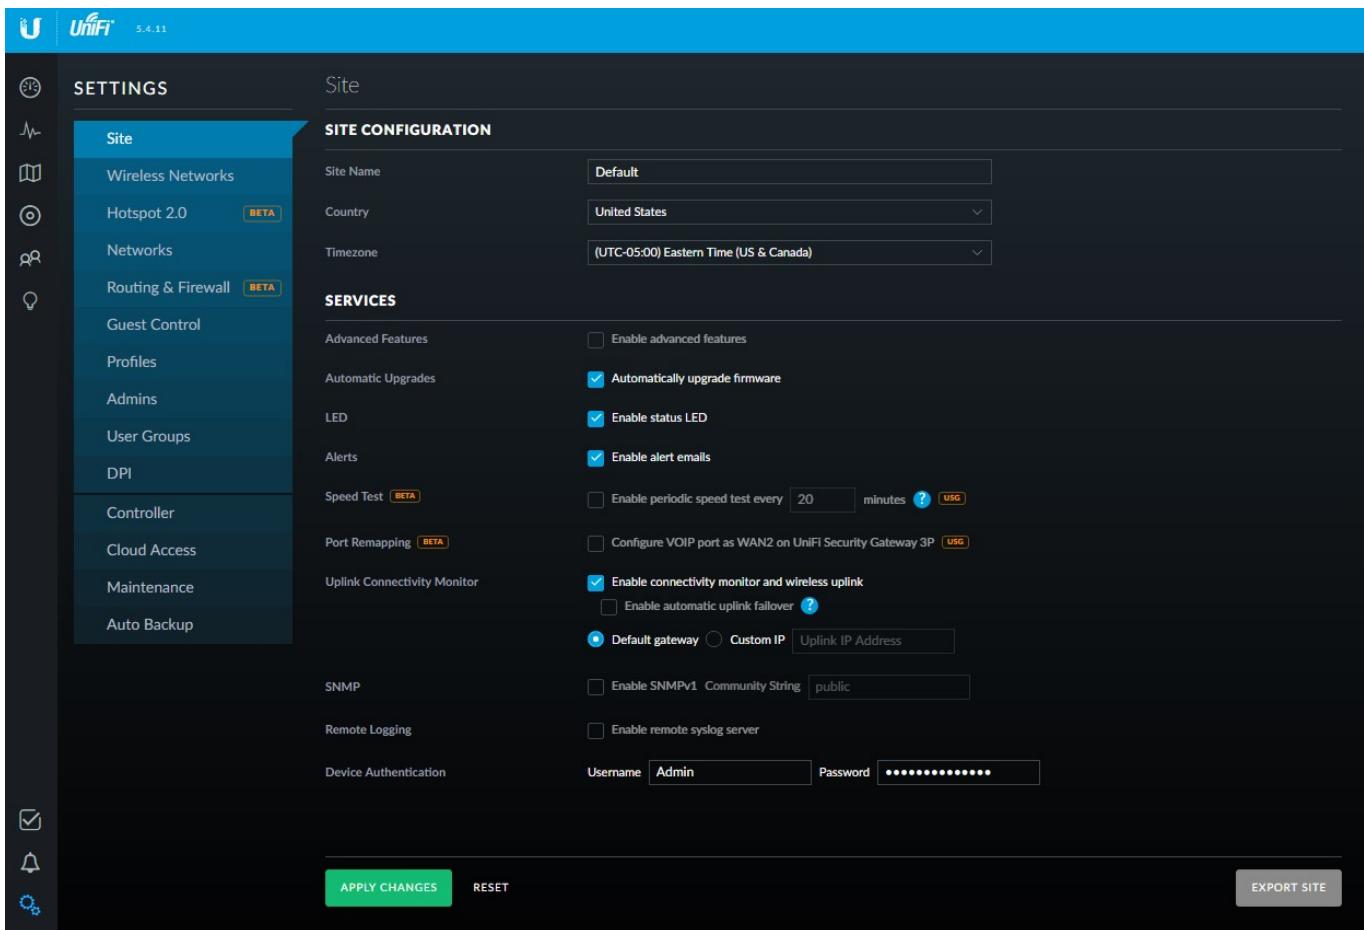

Figure 141 – Settings Button

## 71. UniFi Settings

You should see the Site Tab of the Settings page. Check Automatically Upgrade firmware, and then press Apply Changes. See Figure 142 – UniFi Site Configuration.

The screenshot shows the UniFi Settings page for the 'Site' tab. The left sidebar has a dark theme with various icons and tabs. The 'Site' tab is selected, showing the 'Site Configuration' section. The 'Site Name' is set to 'Default', 'Country' is 'United States', and 'Timezone' is '(UTC-05:00) Eastern Time (US & Canada)'. Under 'SERVICES', 'Automatically upgrade firmware' is checked. Other options like 'Enable advanced features', 'Enable status LED', and 'Enable alert emails' are also present. There are sections for 'Speed Test', 'Port Remapping', 'Uplink Connectivity Monitor', 'SNMP', 'Remote Logging', and 'Device Authentication'. At the bottom, there are 'APPLY CHANGES', 'RESET', and 'EXPORT SITE' buttons.

Figure 142 – UniFi Site Configuration

Click on the Guest Control tab. Under the Access Control section, add:

192.168.3.0/24

to Pre-Authorization Access, then press Apply Changes. See Figure 143 –UniFi Guest Control.

This will allow devices on a Wifi Network designated as using “Guest Policy to (respond to) communications from the Home Network. Remember that the EdgeRouter has firewall rules prohibiting Guest network devices from directly initiating communications with the Home Network. This allows Guest devices to RESPOND to Home Network initiated conversations.

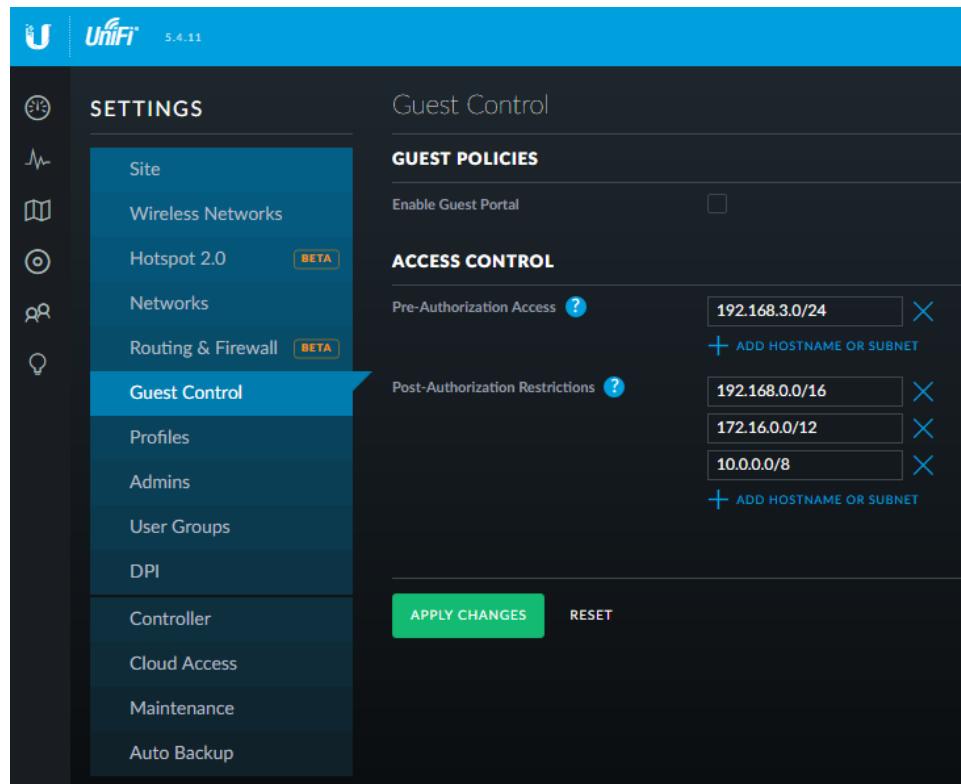

Figure 143 –UniFi Guest Control

Click on the User Groups tab, and then press Create New User Group. See Figure 144 – UniFi Initial User Groups.

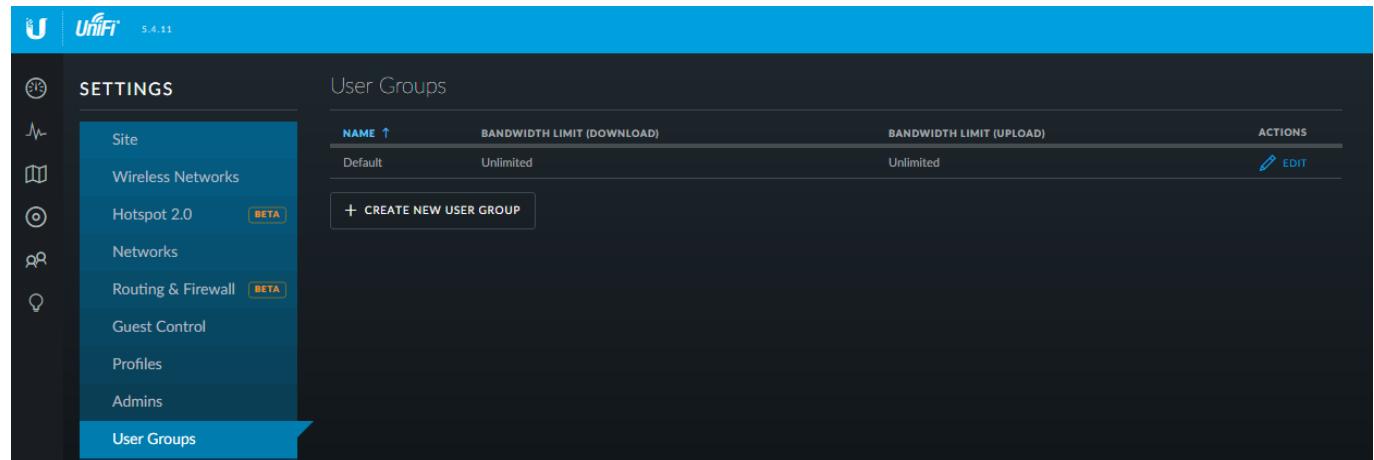

Figure 144 – UniFi Initial User Groups

The following settings allow the Access Point to limit the bandwidth used by users within the guest networks. You may choose to enter different limit values and/or leave either or both of the settings as unchecked. Unchecked is unlimited. The values used here are:

- download speed is limited to 10 Mbps
- upload speed is limited to 2 Mbps.

I believe that the limits are per user, not per network. Reference:

<https://community.ubnt.com/t5/UniFi-Wireless/User-Group-Bandwidth-limit-group-or-user/td-p/1828127>

To use the values that are in this guide, complete the form as follows:

Name	GuestGroup	
Bandwidth Limit (Download)	Checked	10000
Bandwidth Limit (Upload)	Checked	2000

then press Save. See Figure 145 – UniFi Guest Group

The screenshot shows the UniFi Controller's 'User Groups' configuration page. On the left, a sidebar lists various settings like Site, Wireless Networks, and User Groups. The 'User Groups' option is selected. The main area is titled 'CREATE NEW USER GROUP' and contains fields for 'Name' (set to 'GuestGroup'), 'Bandwidth Limit (Download)' (set to 10000 Kbps), and 'Bandwidth Limit (Upload)' (set to 2000 Kbps). Both download and upload checkboxes are checked. At the bottom are 'SAVE' and 'CANCEL' buttons.

Figure 145 – UniFi Guest Group

You should now see the newly created group. See Figure 146 – UniFi New User Groups.

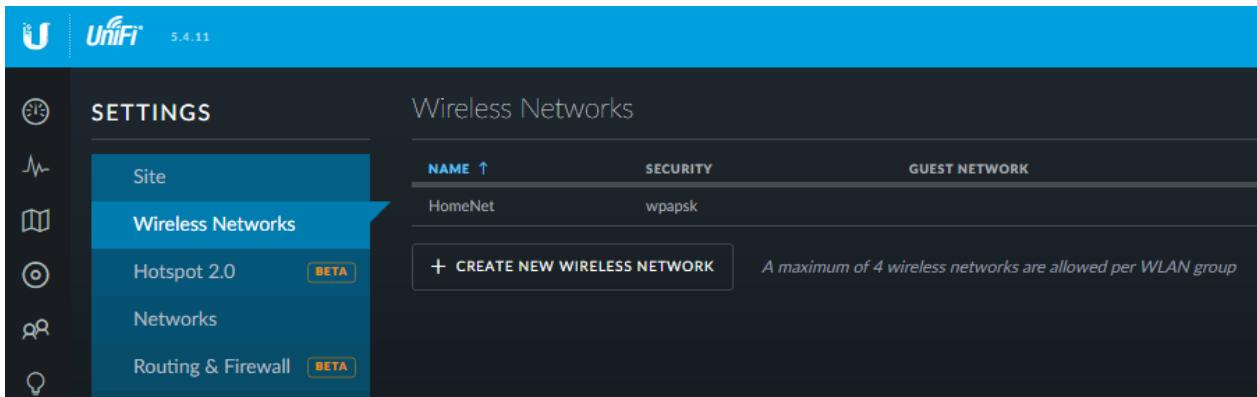

NAME	BANDWIDTH LIMIT (DOWNLOAD)	BANDWIDTH LIMIT (UPLOAD)	ACTIONS
Default	Unlimited	Unlimited	EDIT
GuestGroup	10000 Kbps	2000 Kbps	EDIT  DELETE

Figure 146 – UniFi New User Groups

Additional Link:

<https://help.ui.com/hc/en-us/articles/204911354-UniFi-How-to-Set-Traffic-Bandwidth-Limits>

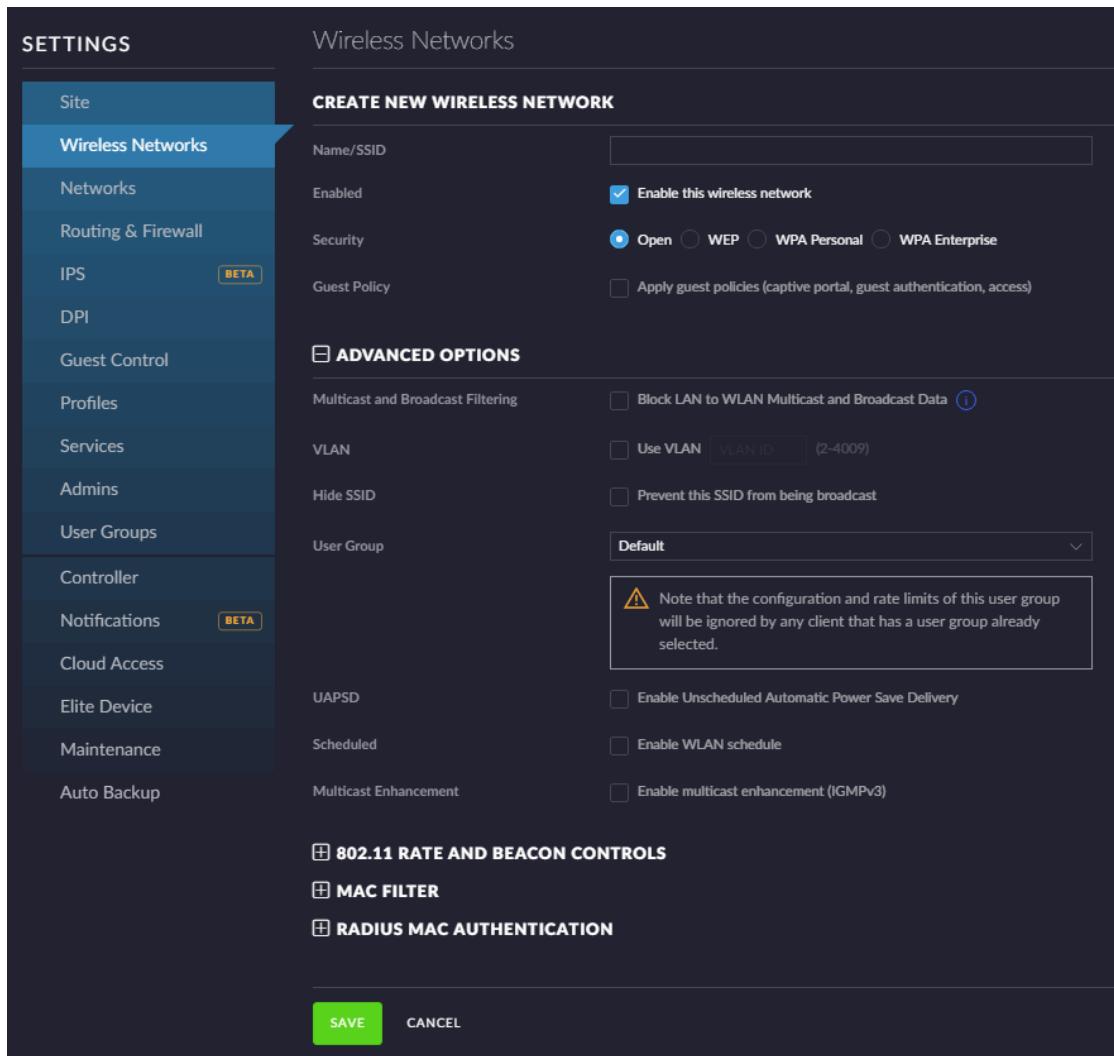

Click on the Wireless Networks tab, you should see the Home Network that was setup earlier. See Figure 147 – UniFi Wireless Network Setup. Click on Create New Wireless Network button

The screenshot shows the UniFi interface under the 'SETTINGS' tab. On the left sidebar, 'Wireless Networks' is selected. The main panel displays a table titled 'Wireless Networks' with one row: 'HomeNet' under 'NAME' and 'wpapsk' under 'SECURITY'. A button labeled '+ CREATE NEW WIRELESS NETWORK' is visible. A note at the bottom states: 'A maximum of 4 wireless networks are allowed per WLAN group'.

Figure 147 – UniFi Wireless Network Setup

Click on Create New Wireless Network button. You may need to open up “Advanced Options”. You will be presented with the Create New Wireless Network dialog. See Figure 148 – UniFi Create New Wireless Network.

This screenshot shows the 'CREATE NEW WIRELESS NETWORK' dialog. The left sidebar lists various settings categories. The main form includes fields for 'Name/SSID' (with a placeholder box), 'Enabled' (checked), 'Security' (set to 'Open'), and 'Guest Policy' (unchecked). An 'ADVANCED OPTIONS' section contains several checkboxes: 'Multicast and Broadcast Filtering' (unchecked), 'VLAN' (unchecked), 'Hide SSID' (unchecked), 'User Group' (set to 'Default'), and three additional options (all unchecked). A warning message in the 'User Group' area notes that configuration and rate limits will be ignored if a client has a user group already selected. At the bottom are 'SAVE' and 'CANCEL' buttons.

Figure 148 – UniFi Create New Wireless Network

**Note that any wireless network which has checked the “Guest Policy” checkbox will isolate ALL devices from every other device on that wireless network.**

Many people do have (groups of) IOT devices which need to communicate with each other to function. Examples are multiple Amazon devices, video cameras and their (storage) servers, etc... Newer versions of the UniFi software have an additional checkbox “Multicast and Broadcast Filtering” (not shown), which also needs to be unchecked to enable the WiFi clients to communicate with each other. See also related sections: 87 - Multicast DNS and 85 - What devices should be placed on which Network?.

Maybe a good compromise for security vs convenience is to:

Enable “Guest Policy” and Enable Broadcast Filtering for the Wi-Fi Guest Network and

Disable “Guest Policy” and Disable Broadcast Filtering for the Wi-Fi IOT Network.

You will need to choose these settings for yourself, based upon your own installed IOT devices.

In the following WiFi setups, I don’t know what to do with the “Multicast Enhancement” checkbox. Mine is Un-Checked, maybe because it was setup so long ago. Here are some References:

<https://help.ubnt.com/hc/en-us/articles/115001529267-UniFi-Managing-Broadcast-Traffic>

<https://community.ubnt.com/t5/airOS-Software-Configuration/quot-Multicast-Enhancement-quot-checkbox/td-p/550452>

<https://community.ui.com/t5/UniFi-Wireless/Enable-multicast-enhancement-IGMPv3-feature/td-p/2249142>

You can change the following settings as suites you. Change / Enter the following information:

Name/SSID	GuestWifi		
Security	WPA Personal		
Security Key	<Enter your own password for the guest wifi network >		
Guest Policy	CHECKED	Apply guest policies	
Multicast ... Filtering	CHECKED	Block LAN to WLAN Multicast ... Data	
VLAN	CHECKED	Use VLAN	6
WPA Mode	WPA2 Only	Encryption	AES/CCMP Only
User Group	GuestGroup		

Press Save. See Figure 149 – UniFi Guest Wif.

**SETTINGS**

**CREATE NEW WIRELESS NETWORK**

Name/SSID	GuestWiFi
Enabled	<input checked="" type="checkbox"/> Enable this wireless network
Security	<input type="radio"/> Open <input type="radio"/> WEP <input checked="" type="radio"/> WPA Personal <input type="radio"/> WPA Enterprise
Security Key	*****
Guest Policy	<input checked="" type="checkbox"/> Apply guest policies (captive portal, guest authentication, access)
	<b>⚠ By default, guest policies will drop broadcast traffic from wireless stations and also block LAN -&gt; WLAN broadcast and multicast data from all except the default gateway. See advanced options for custom whitelisting.</b>

**ADVANCED OPTIONS**

Multicast and Broadcast Filtering	<input checked="" type="checkbox"/> Block LAN to WLAN Multicast and Broadcast Data <a href="#">i</a>
Exception Devices <a href="#">i</a>	<a href="#">i</a> No MAC addresses have been configured.
	<input type="text"/> <a href="#">+ ADD</a>
	<a href="#">+ ADD BATCH</a> <a href="#">+ ADD CLIENTS</a>
VLAN	<input checked="" type="checkbox"/> Use VLAN <input type="text" value="6"/> (2-409)
Fast Roaming <a href="#">BETA</a>	<input type="checkbox"/> Enable fast roaming <a href="#">i</a>
Hide SSID	<input type="checkbox"/> Prevent this SSID from being broadcast

Group Rekey Interval	<input checked="" type="checkbox"/> Enable GTK rekeying every <input type="text" value="3600"/> seconds
User Group	<input type="text" value="GuestGroup"/>
	<b>⚠ Note that the configuration and rate limits of this user group</b>

Figure 149 – UniFi Guest Wif

Click on Create New Wireless Network button.

You can change the following settings as suites you. Change / Enter the following information:

Name/SSID	iotWifi		
Security	WPA Personal		
Security Key	<Enter your own password for the iot wifi network >		
Guest Policy	Un-Checked	Apply guest policies	
Multicast ... Filtering	Un-Checked	Block LAN to WLAN Multicast ... Data	
VLAN	CHECKED	Use VLAN	7
WPA Mode	WPA2 Only	Encryption	AES/CCMP Only
User Group	Default		

Press Save. SeeFigure 150 – UniFi iot WiFi.

The screenshot shows the UniFi Controller's 'Wireless Networks' configuration screen. On the left is a sidebar with various tabs like Site, Wireless Networks (selected), Networks, Routing & Firewall, IPS (Beta), DPI, Guest Control, Profiles, Services, Admins, User Groups, Controller, Notifications (Beta), Cloud Access, Elite Device, Maintenance, and Auto Backup. The main area is titled 'CREATE NEW WIRELESS NETWORK'. It contains fields for Name/SSID (iotWifi), Enabled (checked), Security (WPA Personal selected), Security Key (\*\*\*\*\*), Guest Policy (unchecked), Advanced Options (Multicast and Broadcast Filtering unchecked, VLAN checked with value 7, Fast Roaming unchecked, Hide SSID unchecked, WPA Mode set to WPA2 Only/AES/CCMP Only, Group Rekey Interval checked with value 3600 seconds, User Group set to Default), and a note about user group selection. At the bottom are sections for 802.11 RATE AND BEACON CONTROLS and SCHEDULED.

**CREATE NEW WIRELESS NETWORK**

Name/SSID	iotWifi
Enabled	<input checked="" type="checkbox"/> Enable this wireless network
Security	<input type="radio"/> Open <input type="radio"/> WEP <input checked="" type="radio"/> WPA Personal <input type="radio"/> WPA Enterprise
Security Key	*****
Guest Policy	<input type="checkbox"/> Apply guest policies (captive portal, guest authentication, access)
<b>ADVANCED OPTIONS</b>	
Multicast and Broadcast Filtering	<input type="checkbox"/> Block LAN to WLAN Multicast and Broadcast Data <small>(1)</small>
VLAN	<input checked="" type="checkbox"/> Use VLAN <input type="text" value="7"/> (2-4099)
Fast Roaming	<input type="checkbox"/> Enable fast roaming <small>(1)</small>
Hide SSID	<input type="checkbox"/> Prevent this SSID from being broadcast
WPA Mode	<input type="button" value="WPA2 Only"/> <input type="button" value="Encryption"/> <input type="button" value="AES/CCMP Only"/>
Group Rekey Interval	<input checked="" type="checkbox"/> Enable GTK rekeying every <input type="text" value="3600"/> seconds
User Group	<input type="text" value="Default"/>
<b>802.11 RATE AND BEACON CONTROLS</b>	
UAPSD	<input type="checkbox"/> Enable Unscheduled Automatic Power Save Delivery
Scheduled	<input type="checkbox"/> Enable WLAN schedule
Multicast Enhancement	<input type="checkbox"/> Enable multicast enhancement (IGMPv3)

Figure 150 – UniFi iot WiFi

You should now have the following networks. Note that:

GuestWifi	Checked as Guest	VLAN 6
HomeNet	(Unchecked Guest)	(no VLAN)
IotWifi	(Unchecked Guest)	VLAN 7

See Figure 151 – UniFi Three WiFi Networks.

The screenshot shows the UniFi management interface under the 'SETTINGS' tab. On the left sidebar, 'Wireless Networks' is selected. The main panel displays a table of wireless networks with columns for NAME, SECURITY, GUEST NETWORK, VLAN, and ACTIONS. The table entries are:

NAME	SECURITY	GUEST NETWORK	VLAN	ACTIONS
GuestWifi	wpa2psk	✓	6	<a href="#">EDIT</a> <a href="#">DELETE</a>
HomeNet	wpa2psk			<a href="#">EDIT</a> <a href="#">DELETE</a>
IotWifi	wpa2psk		7	<a href="#">EDIT</a> <a href="#">DELETE</a>

A note at the bottom states: "A maximum of 4 wireless networks are allowed per WLAN group".

Figure 151 – UniFi Three WiFi Networks

If you want to implement another “Spare” WiFi network, you would do that now, following the above steps, but instead specifying:

VLAN                    CHECKED                    Use VLAN                    8.

Click on the DPI tab, and set:

Enable Deep Packet Inspection (DPI)                    On

Press Apply Changes. See Figure 152 – UniFi Deep Packet Inspection

The screenshot shows the UniFi management interface under the 'SETTINGS' tab. On the left sidebar, 'DPI' is selected. The main panel displays a 'Deep Packet Inspection' configuration section with a toggle switch labeled 'Enable Deep Packet Inspection (DPI)' set to 'ON'. Below the switch are buttons for 'CLEAR DPI COUNTERS', 'APPLY CHANGES', and 'RESET'.

Figure 152 – UniFi Deep Packet Inspection

Return to the Dashboard screen by pressing the Dashboard button. See Figure 153 – UniFi Dashboard Button.

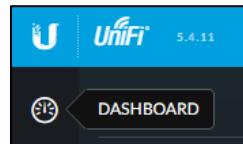

Figure 153 – UniFi Dashboard Button

In the upper right part of the dashboard screen is the Open Properties button. Press the button. See Figure 154 – UniFi Open Properties Button

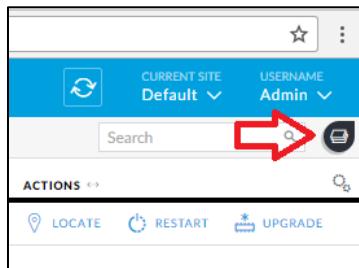

Figure 154 – UniFi Open Properties Button

These are the Properties of the access point. There are some nice settings in here. See Figure 155 – UniFi Access Point Properties.

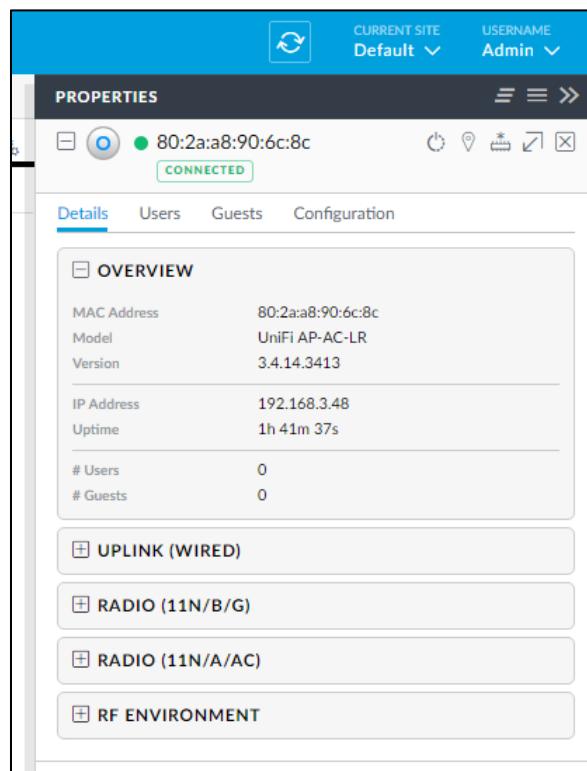

Figure 155 – UniFi Access Point Properties.

## 72. UniFi WLAN Groups

This section is optional. I have setup, and am managing a couple of Access Points for other people / installations, and do not want all these installations to be using the same set of SSIDs and passwords. A WLAN Group holds a group of settings for a single or for multiple Access Points. An Access Point can only belong to one WLAN Group.

To setup a WLAN Group, first select the Settings button, near the lower left side of the screen, and press it. Reference Figure 141 – Settings Button. Next, click on the Wireless Networks tab, and (in the upper right) select the large “+” sign to the right of the WLAN Group text. See Figure 156 – UniFi Add WLAN Group.

The screenshot shows the UniFi management interface. On the left, a sidebar titled 'SETTINGS' has 'Wireless Networks' selected. The main area is titled 'Wireless Networks' and shows a table of existing networks:

NAME ↑	SECURITY	GUEST NETWORK	VLAN	ACTIONS
SSID1	wpapsk	✓	6	<span>EDIT</span> <span>DELETE</span>
SSID2	wpapsk			<span>EDIT</span> <span>DELETE</span>
SSID3	wpapsk		7	<span>EDIT</span> <span>DELETE</span>

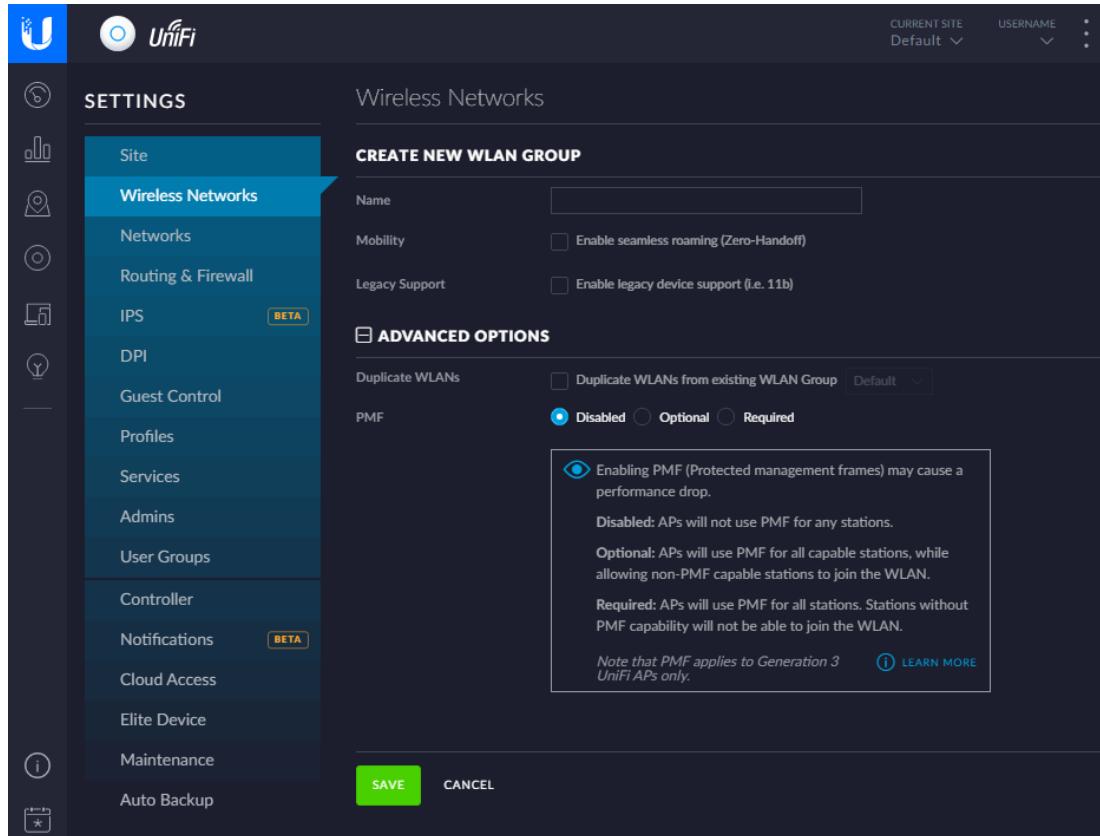

Below the table is a button labeled '+ CREATE NEW WIRELESS NETWORK'. A note at the bottom states: 'A maximum of 4 wireless networks are allowed per WLAN group when connectivity monitor is enabled'.

Figure 156 – UniFi Add WLAN Group.

You will now see a dialog allowing you to create a new WLAN Group. Fill in the following information:

- |                 |                                                                         |
|-----------------|-------------------------------------------------------------------------|
| Name            | <Name of new WLAN Group>                                                |
| Duplicate WLANs | Check this if you want to copy an existing WLAN Group to this new group |

Press Save when done. See Figure 157 – UniFi Create New WLAN Group.

The screenshot shows the UniFi interface under the 'SETTINGS' tab, specifically the 'Wireless Networks' section. A modal dialog titled 'CREATE NEW WLAN GROUP' is open. It contains fields for 'Name' (with a placeholder), 'Mobility' (checkbox for 'Enable seamless roaming (Zero-Handoff)'), and 'Legacy Support' (checkbox for 'Enable legacy device support (i.e. 11b)'). Below these are sections for 'ADVANCED OPTIONS' and 'PMF'. Under 'ADVANCED OPTIONS', there's a checkbox for 'Duplicate WLANs from existing WLAN Group' and dropdowns for 'Default' and 'Optional'. Under 'PMF', there are three radio button options: 'Disabled' (selected), 'Optional', and 'Required'. A note explains that enabling PMF may cause performance drops. Below this, another note states that PMF applies to Generation 3 UniFi APs only. At the bottom of the dialog are 'SAVE' and 'CANCEL' buttons.

Figure 157 – UniFi Create New WLAN Group.

Select the new WLAN Group you just created, and edit all the group's items as desired. See Figure 158 – UniFi Select Newly Created WLAN Group.

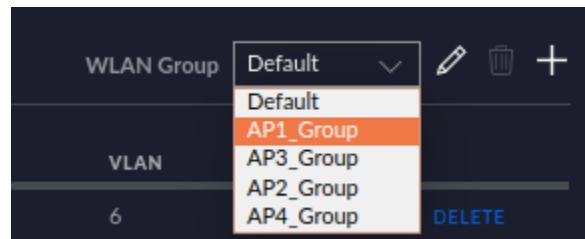

Figure 158 – UniFi Select Newly Created WLAN Group.

Now we need to select a particular Access Point, and set it to belong to / have it use the newly defined WLAN group. Select:

1. Devices.
2. <Your Access Point>.
3. Configure Tab.
4. Expand the WLANS Item.
5. For the 2.4 GHz WLAN Group, select which group you want (Shown selecting “AP1\_Group”.)
- 5A. Queue the changes (not shown)
6. For the 5 GHz WLAN Group, select the same group as was chosen for 2.4GHz WLAN Group.
- 6A. Queue the changes (not shown)
- 6B. Apply the changes (not shown)

See Figure 159 – UniFi Utilize a WLAN Group.

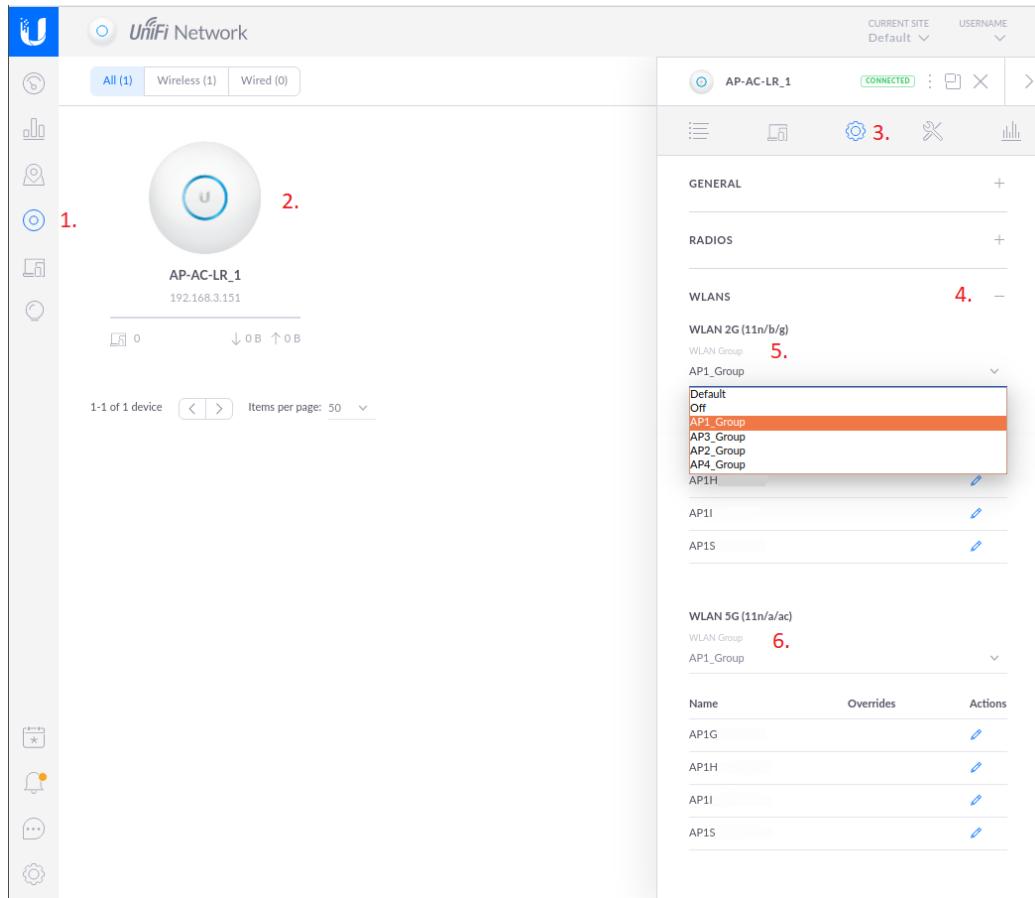

Figure 159 – UniFi Utilize a WLAN Group.

Reference: <https://help.ubnt.com/hc/en-us/articles/205204020-UniFi-WLAN-Groups>

An Alternate Method: <https://community.ui.com/questions/Need-different-SSIDs-for-each-Access-Point-/133c3eb7-7730-40fa-98e6-695d8a92aa8e>

## 73. Setting UniFi / Access Point's SSIDs, Channels, and Power Levels

Your Access Point should now be running. You may have one or multiple APs in your installation. Everything that I have read, says that all APs, of a particular WLAN group, should be provisioned with the same set of SSIDs. This should allow for mobile client devices (Cellphones, tablets, etc.) to transition from one physical AP to another AP when they are roaming around this WLAN Group's installation area.

Now we come to channel assignments and power levels. This is only what I have read and/or done for my installation. U.S.A only, others countries will likely vary.

### Channel assignment for the 2.4GHz band.

Only choose channels 1 or 6 or 11. Fix the channel; don't set to "Auto". Set channel width to HT20. These three channels are the only clear / non-overlapping frequencies. See (probably not-exact scale and borrowed from the Internet) Figure 160 – 2.4 GHz Channel Frequencies.

I think that channel 1 can be "interfered with" by any of your neighbors using an overlapping channel of 2, 3, 4, and 5. Similarly, I think that channel 11 can be "interfered with" by anyone nearby using an overlapping channel of 8, 9, 10, and 7. I also contend that channel 6 should be used last, since it appears that channel 6 can be "interfered with" by anyone nearby using any overlapping channels of 3, 4, 5, 7, 8, 9, and 2, 10.

If you have four or more APs, you will need to take your layout / geometry into account for the 2.4 GHz channel assignments, because at-least two APs will need to share the same channel.

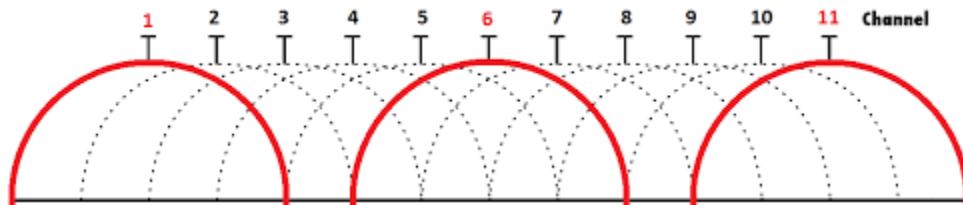

Figure 160 – 2.4 GHz Channel Frequencies.

### Channel assignment for the 5GHz band.

Only choose channels 36/40/44/48. Fix the channel; don't set to "Auto". Avoid DFS channels. Set channel width to VHT40. Optional upper channels are 149/153/157/161/165. These upper channels may operate with lower power, and it might be that some older clients may not operate with these upper channels.

### Power Levels

I set my 2.4GHz power level to Medium; and the 5GHz power level to High.

### Band Steering

In the same settings area, you have the choice of:

Prefer 5G,      Balanced,      Off

I left my set to the default of Off.

### Other Settings

I left them alone. There are lots of different UniFi / AP settings and hundreds of postings (and opinions) about them, have fun experimenting.

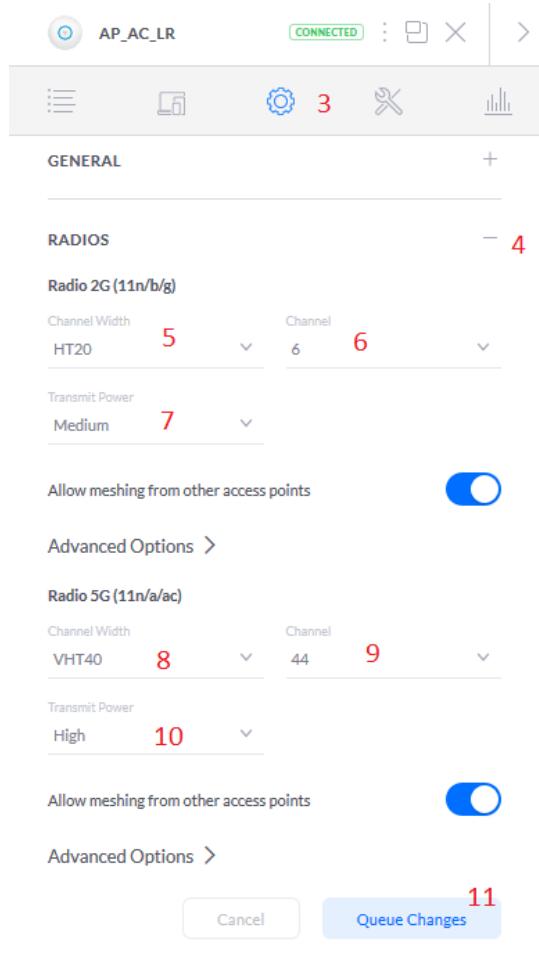

### How to set these:

For context, reference text near, and also Figure 159 – UniFi Utilize a WLAN Group.

To set channels and power levels for a particular Access Point, select the following:

1. Devices. (not shown)
2. <Your Access Point>. (not shown)
3. Configure Tab.
4. Expand the Radios Item.
5. Set the 2.4 GHz Channel Width.
6. Set the 2.4 GHz Channel.
7. Set the 2.4 GHz Transmit Power.
8. Set the 5 GHz Channel Width.
9. Set the 5 GHz Channel.
10. Set the 5 GHz Transmit Power.
11. Queue the changes.
12. Apply the changes (not shown, but near the bottom)

See Figure 161 – Setting AP's Channel / Power Level.

**Figure 161 – Setting AP's Channel / Power Level.**

## Some UI.com References:

@AmazedMender16 (Original posting data slightly edited and also re-formatted for clarity)

2.4 GHz: Channel width: HT20      Chanel: 1/6/11      Transmit Power: Low/Medium  
(Do an RF scan to get the clearest channel)

5GHz: Channel width: VHT40      Chanel: 36/40/44/48      Transmit Power: High  
(Avoid DFS channels, do an RF scan to get the clearest channel)

Could also modify your DTIM Periods if you have more modern devices on the network.

*Settings > Wireless Network > Edit > Advanced Options > Rate And Beacon Controls*

DITM 2G Period: 3      DITM 5G Period: 3

<https://community.ui.com/questions/2-x-UAP-AC-LT-slow-for-android-devices/a7f6d270-5b13-4cff-9634-ee004b115223#answer/ee293714-8dee-4d94-955c-d37e891cda4d>

@clarksn (Original posting data slightly edited)

... the general advice is to set radio powers as low as possible. typically this means 2G radio power to Low and 5G power to Low or possibly medium; you can also use RSSI in advanced settings to facilitate clients roaming to the "best" AP.

There is a bit of "artistry" though and trial and error in refining the setup!

In my guest house for example I have all my 2G APs on 1, 6 or 11 keeping APs on the same channel as far away as possible and on Low power and RSSI -75dbm. In the 5G space I have all the APs on different channels and Medium power, with band steering enabled and RSSI -75dbm (with them on low power in the 5G space I find most clients use 2G even with band steering enabled)

<https://community.ui.com/questions/Multiple-APs-should-use-different-channels-but-the-same-SSID/7c103b86-0b80-42b9-ba6f-588b784734d4#answer/e4755530-2b90-44cb-8794-92ec0db004bf>

@gregorio

You might try to move away from DFS channels. Devices cannot scan them and therefore need to wait until a beacon is heard. Even though beacons are very often, it does impact roaming. Have you checked RSSI overlap? Do you have anything like Fast Roaming or High Performance Devices enabled in the wireless configs? They, along with Connection Monitor, WiFi AI and Auto Optimize should all be disabled as they can cause problems.

<https://community.ui.com/questions/ER-X-and-2-UAP-AC-PRO-hand-over-1-and-Lan-Vlan-access-2/e618495e-7d75-420e-9e8c-9e6537ab3397#answer/d7bb1115-7547-4401-8e26-a4aa79eee6d3>

## 74. UniFi STUN / Channel Scanning

One of the references in section 73 - Setting UniFi / Access Point's SSIDs, Channels, and Power Levels mentioned performing a channel scan to determine the best (most-uncongested) WiFi channel. When I tried to do a channel scan, I got an error similar to "This device is not able to connect to the internal STUN server on your Controller. Please check if the device is able to reach the STUN server on port 3478".

I determined, via a STUN Troubleshooting guide, that a port-forwarding / NAT rule was needed in the ER-X. For this rule to operate, you must first reserve device addresses for your "UniFi Controller" and all of your Access Point(s) per Table 5 - Table of Reserved Address. Reserve the addresses for your "UniFi Controller" and all of your Access Point(s) by following section 80 - Reserving Device Addresses via DHCP. You may need to re-boot these devices to ensure that they are using the newly reserved addresses.

To generate the needed Destination NAT rule, perform similar steps as contained in section 60 - Optional DNS Forcing of the WIFI\_GUEST\_LOCAL Network, but enter the information from Figure 162 – STUN DNAT Rule Data.

The screenshot shows the 'Destination NAT Rule Configuration' dialog box. The configuration is as follows:

- Description:** UniFiStunNAT
- Enable:** Checked
- Inbound Interface \***: switch0.1
- Translations \***:
  - Address**: 192.168.3.4
  - Port**: 3478
- Exclude from NAT**: Unchecked
- Enable Logging**: Unchecked
- Protocol**: UDP (selected radio button)
- Src Address**: 193.168.3.10-192.168.3.19
- Src Port**: (empty)
- Src Address Group**: (empty dropdown)
- Src Network Group**: (empty dropdown)
- Src Port Group**: (empty dropdown)
- Dest Address**: 192.168.3.1
- Dest Port**: 3478
- Dest Address Group**: (empty dropdown)
- Dest Network Group**: (empty dropdown)
- Dest Port Group**: (empty dropdown)

At the bottom right are the **Save** and **Cancel** buttons.

Figure 162 – STUN DNAT Rule Data.

With this rule, when the ER-X router sees an incoming UDP packet:

Addressed to 192.168.3.1 (i.e. itself)

With a destination port of 3478

And a source address of 192.168.3.10 through 192.168.3.19, (i.e. from an Access Point)

it re-writes / re-transmits the packet to address 192.168.3.4 (i.e. the Cloud-Key) with a destination port number of 3487 (i.e. unchanged port.)

This allows the Access Point's STUN requests / data to be able to be sent to the Unifi Controller, allowing processing. For context on the following, reference text near, and also Figure 159 – UniFi Utilize a WLAN Group.

To channel scan, do the following:

1. Devices. (not shown)
2. <Your Access Point>. (not shown)
3. Tools Tab.
4. Expand the RF Environment item.
5. Select the band to scan, 2G or 5G.
6. Select scan.

This will take your selected Access Point offline for several minutes for the scanning. See Figure 163 – Channel Scanning Context.

Figure 163 – Channel Scanning Context.

**References:**

UniFi Troubleshooting STUN Communication Errors

<https://help.ui.com/hc/en-us/articles/115015457668-UniFi-Troubleshooting-STUN-Communication-Errors>

## 75. UniFi Configuration Backup

Find the Settings button, near the lower left side of the screen, and press it. See Figure 141 – Settings Button. You should see the Maintenance Tab of the Settings page. Press it. Reference Figure 164 – UniFi Maintenance Screen.

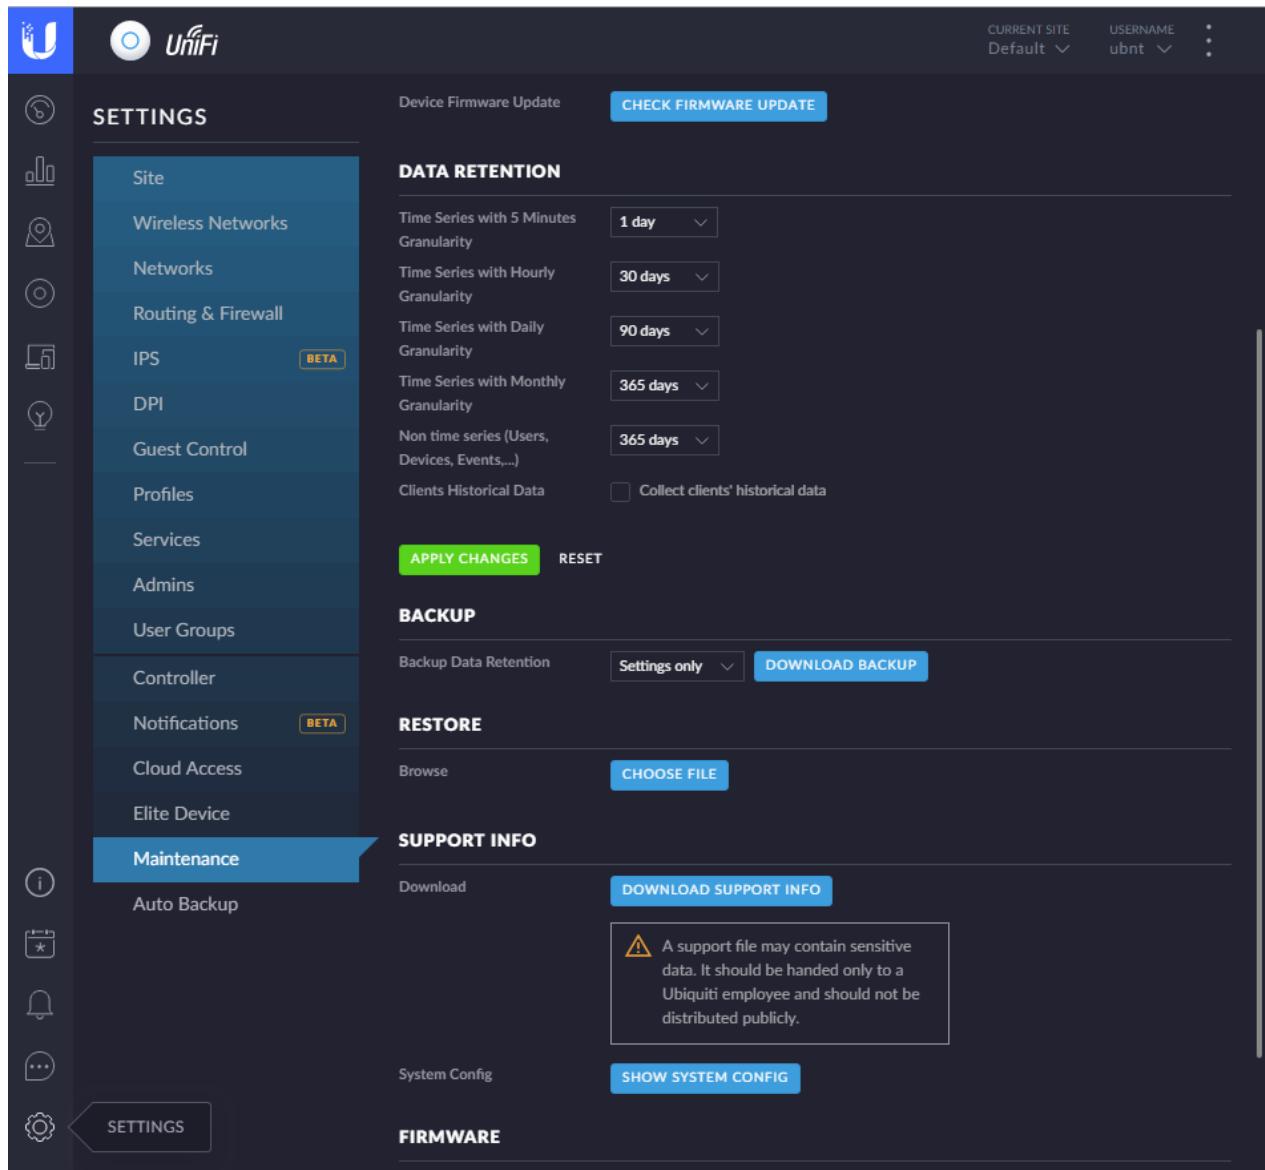

Figure 164 – UniFi Maintenance Screen

In the middle of this screen is a BACKUP section. Before I backup, I change my backup setting to be ‘Settings only’. Press the ‘DOWNLOAD BACKUP’ button and store the resultant file. This is your access point configuration backup.

You can now exit the UniFi browser and close the UniFi Controller Software by pressing the X in the upper-right corner, as shown in Figure 123 – UniFi Controller Software Running. If you are running from a Raspberry Pi, you will want to shut it down cleanly. The UniFi software utilizes a database, which does not like to have power abruptly removed.

Links:

UniFi - Methods for Capturing Useful Debug Information

<https://help.ubnt.com/hc/en-us/articles/227129127>

This is the end of the Access Point / UniFi setup.

The following sections are additional EdgeRouter configuration steps.

---

## 76. Timed Based Firewall Rules

Several people have wanted to restrict their children's Internet usage based upon time. Here are some sample links:

<https://community.ubnt.com/t5/EdgeMAX/Restrict-WAN-Access-to-from-LAN-Clients-by-Specific-IP-By-Time/td-p/2083140>

<https://community.ubnt.com/t5/UniFi-Wireless/User-based-time-control-of-wifi-access/td-p/1490803>

<https://community.ubnt.com/t5/EdgeMAX/Time-control-parental-controll/td-p/1035259>

<https://community.ubnt.com/t5/EdgeMAX/Set-up-time-limits-for-kids-internet-access/td-p/1824135>

<https://community.ubnt.com/t5/EdgeMAX/Parental-controls-time-of-day-routing-content-filtering/td-p/1268520>

---

## 77. Double-NAT

When one firewall/router is behind another firewall/router, that combination is called double-NAT. Each router performs Network-Address-Translation (NAT.) Each router will introduce a small time delay as it processes IP packets. If you are running a server behind your (inner) router, then Double NAT can be particularly difficult to configure. Most people in the Ubiquiti forums hate Double-NAT.

Once the EdgeRouter 's firewall has been enabled / configured, the EdgeRouter can (but does not have to) be your main and only router. Remember to replace and then remove the default 'ubnt' login before using the ER-X as your internet facing router.

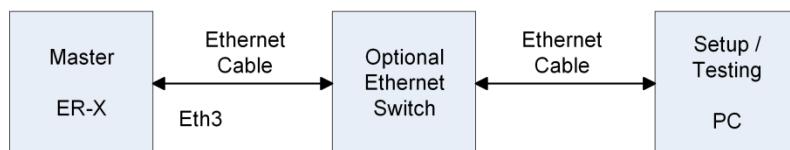

---

## 78. Configuring a Second / Testing ER-X

It is handy to have a second, already-configured, ER-X on hand as a cold spare. If you are considering using "Adblocking and Blacklisting" from section 81, you could configure one ER-X with Adblocking and one ER-X without Adblocking. Testing that feature is now as easy as the five minutes it takes to swap routers.

To configure a Second/ Testing ER-X, it is important that the IP address presented to the WAN port NOT be within one of our internal IP address ranges. Reference section 5 - EdgeRouter IP Address Use and Table 1 - Table of Networks for that data.

Normally your Setup/Testing PC would be wired directly (or through a switch) to your "Master" ER-X. See Figure 165 – Typical Testing PC Setup.

**Figure 165 – Typical Testing PC Setup**

One way of presenting a different IP address to the Second/Testing ER-X, is to insert your leftover consumer router (with its LAN configured for 192.168.[0,1,2].X) before your Second / Testing ER-X router. The Testing ER-X then connects to your Setup/Testing PC. See Figure 166 – Second / Testing ER-X Wiring.

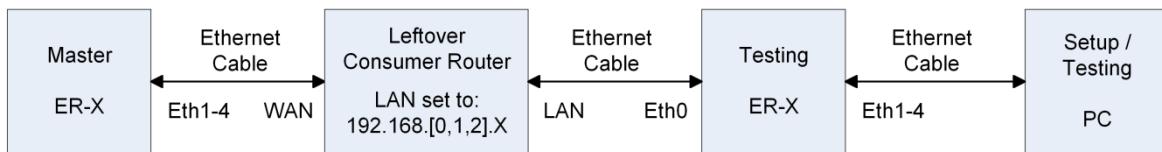

Figure 166 – Second / Testing ER-X Wiring

Another alternative is to use RFC-5737 addresses. @BuckeyeNet posted about them at:

<https://community.ui.com/questions/Connecting-Two-ER-X-Routers/7e91a2f5-53c3-4ece-859a-558ab25d4940#answer/017707ac-e0eb-41e0-b58c-c2c30b35969>

---

## 79. Ubnt Discovery

Recently, the Ubnt Discovery service has shown up in an EdgeRouter Community posting:

<https://community.ubnt.com/t5/EdgeRouter/EdgeOS-responds-to-udp-10001-probes-even-if-service-ubnt/td-p/1886105>

"The default WAN firewall policies added by the Basic Setup wizard will block all probes to UDP/TCP port 10001 and will prevent the EdgeRouter from being discoverable on the WAN."

Per <https://help.ubnt.com/hc/en-us/articles/204976244>

If you still want to disable this service, the following may help you:

[UBNT-discover] - Add CLI command to disable "ubnt-discovery" daemon, thus ER will stop responding to discovery messages on 10001 UDP port. (**set service ubnt-discover-server disable**).

Reference <https://community.ubnt.com/t5/EdgeMAX-Updates-Blog/EdgeMAX-EdgeRouter-software-release-v1-10-0/ba-p/2233263>

[Discovery] - UBNT discovery daemon can be configured to listen to TCP discovery requests (by default it listens to UDP only). This feature can be enabled with "set service ubnt-discover-server protocol tcp\_udp" CLI command.

<https://community.ubnt.com/t5/EdgeMAX-Updates-Blog/EdgeMAX-EdgeRouter-software-release-v1-10-7/ba-p/2513718>

---

## 80. Reserving Device Addresses via DHCP

When you have the ER-X reserve a DHCP address for a device, that device will always be presented with the same IP address. This is useful for devices like servers. This is different than “fixing” a device’s IP. Fixing usually involves configuring the device itself, to use a certain IP address. Reserving addresses has the added benefit that the rest of the DHCP settings continue to be presented to the device. Static mapping is another term for reserving.

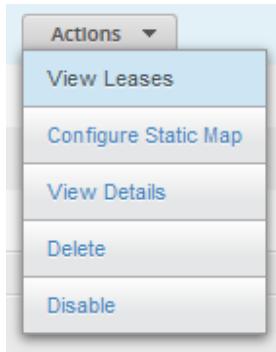

Before you start reserving your own IP Addresses, other sections of this guide may depend upon specific reserved addresses for correct operation. I would suggest that you not reserve any of the addresses shown in Table 5 - Table of Reserved Address for your general purpose devices.

ER-X	(192.168.3.1)
Pi Hole 1	192.168.1.2
Pi Hole 2	192.168.1.3
UniFi Controller	192.168.1.4
Reserved / Future Use	192.168.1.5 - 192.168.1.9
Access Point 1 - 10	192.168.3.10 - 192.168.3.19

**Table 5 - Table of Reserved Address**

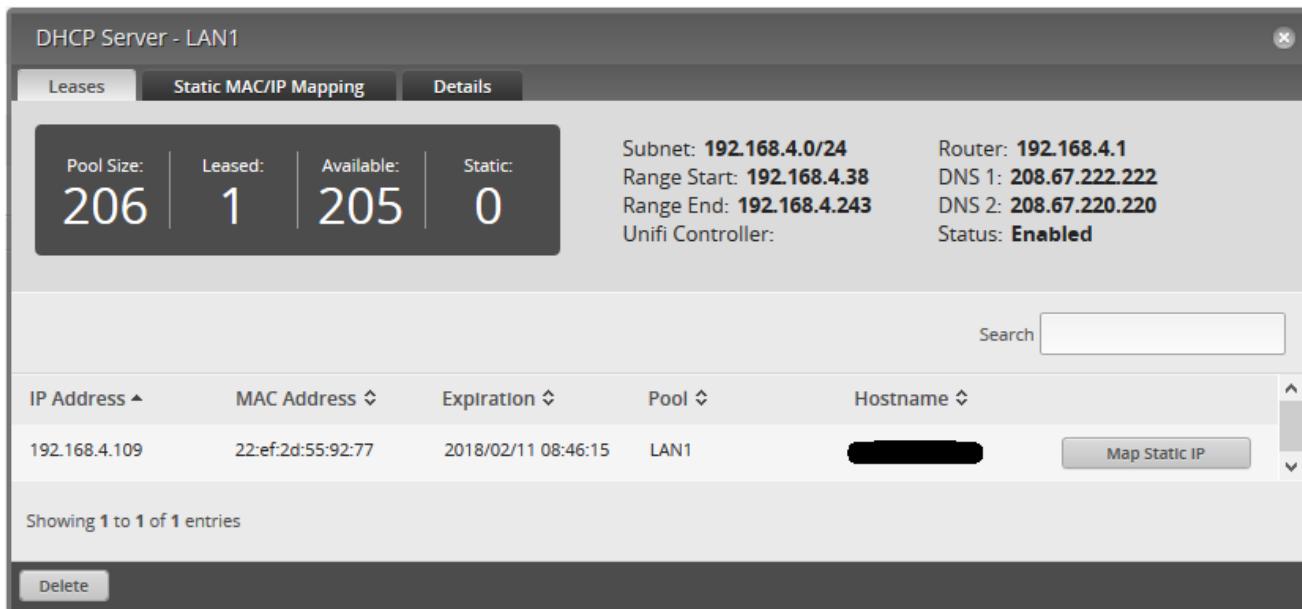

Ensure your device is powered-on and connected to the Network you wish.

To reserve an IP address, select the “Services” button. Reference Figure 52 – Services Button. Ensure that the “DHCP Server” tab is selected. Reference Figure 53 – DHCP Server Screen. Find the correct DHCP line for your Network, follow it to the right side, to the line’s “Actions” button. Click the “Actions” button. You will be presented with a list of actions. Choose “View Leases”, See Figure 167 – View Leases Button.

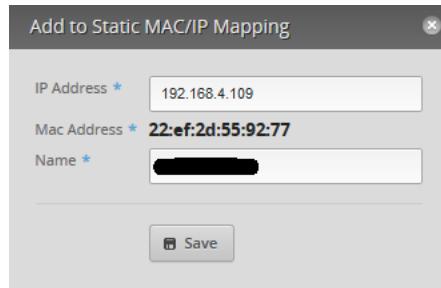

**Figure 167 – View Leases Button.**

You will be presented with a DHCP Server Dialog. This dialog will contain a list of your devices which have acquired a dynamic DHCP lease. See Figure 168 – DHCP Server Leases Dialog.

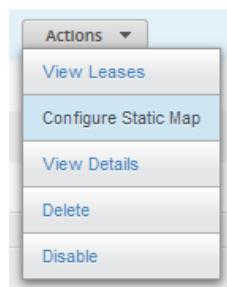

**Figure 168 – DHCP Server Leases Dialog.**

To reserve an IP address for that device, Press the “Map Static IP” button near the right side of the screen, for the correct device. You will be presented Figure 169 – Static IP Mapping Dialog.

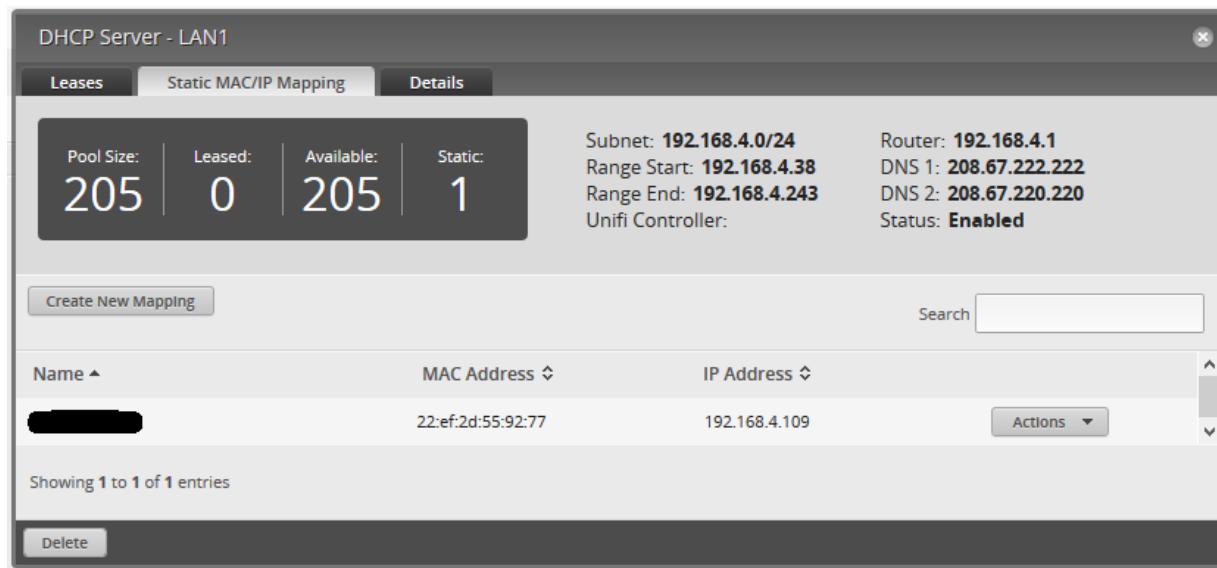

**Figure 169 – Static IP Mapping Dialog.**

You can modify the IP address to a different one or just leave it. If you modify it, only change the last octet (the last number.) Press “Save”, then close the DHCP Server Leases dialog. If you modified the presented IP address, you will need to “release” and “renew” the devices IP address and/or reboot that device now. To view static IP reservations, find the Actions button, and click the “Configure Static Map” button. See Figure 170 – Configure Static Map Button.

**Figure 170 – Configure Static Map Button.**

You will be presented with a list of reserved IP addresses for the chosen DHCP server. See Figure 171 – Static IP Mapping Dialog.

**Figure 171 – Static IP Mapping Dialog.**

Note that you may need to re-boot these newly-reserved devices, to ensure that they acquire the correct / newly reserved address(es).

---

## 81. Adblocking and Blacklisting

This is optional. This seems to work flawlessly. Also reference section 82 - Pi-Hole Network-wide Ad Blocking.

You should note before implementing this section that some web sites / web pages you may wish to visit will be blocked by this code. In some cases you may not be able to determine which URLs in the blocking lists are blocking which sites / page you want to visit, as some website links 'redirect' through advertisers' sites. These advertisers' sites will now be blocked. This includes some Google searches.

There are a number of similar posts with different version numbers. I had to use an SSH package (e.g. putty for Windows) to paste the following commands into the EdgeRouter, as the CLI doesn't seem to support copy / paste.

Reference: <https://community.ubnt.com/t5/EdgeMAX/DNS-Adblocking-and-Blacklisting-dnsmasq-Configuration/td-p/2215008>

See also: <https://github.com/britannic/blacklist>

The following text is cached from the above URL when the stated version was at V1.1.7.4.

You should check for updated information and use the newest code and any newer directions.

First ensure the router has enough space (2 lines):

```
sudo apt-get clean cache  
delete system image
```

Installation (2 lines):

```
curl -L -O  
https://raw.githubusercontent.com/britannic/blacklist/master/edgeos-  
dnsmasq-blacklist_1.1.7.4_mipsel.deb  
  
sudo dpkg -i edgeos-dnsmasq-blacklist_1.1.7.4_mipsel.deb
```

Removal, if ever wanted (1 line):

```
sudo apt-get remove --purge edgeos-dnsmasq-blacklist
```

Upgrade:

Since dpkg cannot upgrade packages, follow the instructions under Installation and the previous package version will be automatically removed before the new package version is installed

There is much more listed at this post.

When I installed this, I saw the following lines:

```
Total entries found: 99770  
Total entries extracted 81838  
Total entries dropped 17932
```

Some more links:

<https://britannic.github.io/blacklist/#frequently-asked-questions>  
<https://github.com/britannic/blacklist/blob/master/CHANGELOG.md>  
<https://britannic.github.io/blacklist/#frequently-asked-questions>

There is also an associated project located at: <https://github.com/britannic/pixelserv> (which I have not tried.)

Reference the following from his post:

dnsmasq may need to be configured to ensure blacklisting works correctly

Here is an example using the EdgeOS configuration shell

```
configure
set service dns forwarding cache-size 2048
set service dns forwarding except-interface [Your WAN i/f]
set service dns forwarding name-server [Your choice of IPv4 Internet Name-Server]
set service dns forwarding name-server [Your choice of IPv4 Internet Name-Server]
set service dns forwarding name-server [Your choice of IPv6 Internet Name-Server]
set service dns forwarding name-server [Your choice of IPv6 Internet Name-Server]
set service dns forwarding options bogus-priv
set service dns forwarding options domain-needed
set service dns forwarding options domain=mydomain.local
set service dns forwarding options enable-ra
set service dns forwarding options expand-hosts
set service dns forwarding options localise-queries
set service dns forwarding options strict-order
set service dns forwarding system
set system name-server 127.0.0.1
set system name-server '::1'
commit; save; exit
```

For testing, I picked a well-known advertisement site owned by Google. I tried and couldn't get there.

Thanks to @britannic for this.

Also reference <https://github.com/britannic/blacklist#frequently-asked-questions> especially the section titled "EdgeOS dnsmasq Configuration". This appears to be the same text as above.

---

## 82. Pi-Hole Network-wide Ad Blocking

I have not (yet) tried this. Looks VERY interesting. Also Reference section 81 - Adblocking and Blacklisting.

---

## 83. Coalescing the Wired Iot and Wifi Iot Networks

This optional section allows the coalescence of the Wired Iot and Wifi Iot Networks. I HIGHLY recommend that this section be followed. Among other items, this combines the Wired IOT Network (as 192.168.4.X) and the Wi-Fi IOT Network (as 192.168.7.X) as a single Network / Subnet.

This involves enabling switch0 to be VLAN Aware. When configuring switch0 to be VLAN Aware, it is important to NOT be connected to an EdgeRouter port which is using switch0. I used the Wired Separate Network (which is not in switch0, if you followed previous sections) for these re-configuration steps. I locked myself out of my ER-X EdgeRouter (and had to factory reset / reload the base configuration) about 4 times while researching and writing this section. You should generate a backup, right now, if you are going to implement this.

I have now converted my ER-X to being VLAN Aware.

Login to EdgeRouter

The following (temporarily) allows the Wired Separate Network to access the EdgeRouter itself.

```
Firewall/NAT
    Firewall Policies
        WIRED_SEPARATE_LOCAL -> Actions -> Configuration
            Default Action: Accept
            Save Ruleset
```

Disconnect your computer's Ethernet cable from eth3 / Home Network. Wait 5 to 10 seconds. Re-connect your computer's Ethernet cable to eth2 / Wired Separate Network.

Open a new Browser window/tab and enter a URL of 192.168.5.1 and Login to the EdgeRouter

Now we are connected to the EdgeRouter without using switch0.

Move the Home Network Address setup from switch0 to vid 1.

```
Dashboard
    Home Net switch0 -> Actions -> Config
        Config Tab
            Address:          No address
            Save

Dashboard
    Add Interface
    Add VLAN
        VLANID:          1
        Interface:        switch0
        Description:      Home Net
        MTU:              1500
        Address:          Manually define IP Address
                          192.168.3.1/24
        Save
```

Remove the address range from Wired Iot Network.

```
Dashboard
    Wired Iot Net / eth1 -> Actions -> Config
        Address:          No address
        Save
```

Remove firewall rules from Wired IoT Network.

```
Firewall/NAT
  Firewall Policies
    WIRED_IOT_LOCAL -> Actions -> Edit Ruleset
      Rules Tab
        Rule 2-> Action -> Delete Rule, Yes
        Rule 1-> Action -> Delete Rule, Yes
      Interfaces Tab
        Set Interface --
        Set Direction -
        -Remove
        Save Ruleset
    WIRED_IOT_LOCAL -> Actions -> Delete Ruleset, Yes
```

Delete the Wired IoT Network DHCP server.

```
Services
  DHCP Server
    WiredIoTDHCP
      Actions Delete
      Yes
```

Move Home Network firewall rules from switch0 to vid 1

```
Firewall/NAT
  Firewall Policies
    HOME_OUT Actions -> Interfaces
      Interfaces: switch0.1
      Save Ruleset
```

Enable switch0 to be Vlan Aware.

Note: If the dialog gets stuck, click the Config Tab, then click the Vlan tab to refresh the dialog / size.

Note that you could optionally add “eth3 vid 6,7,8” if you have multiple Access Points AND will be wiring them through a smart Ethernet switch connected to eth3. I did not do this, so the Wifi data on VLANs 6, 7, 8 is not visible / leaks-to any equipment attached to eth3. When I connected multiple APs, I connected them via a (smart) switch connected to eth4.

```
Dashboard
  Switch0 Config
    Vlan
      Vlan Aware Enabled checked
      eth0 UNCHECKED
      eth1 checked
      eth1 pvid 7
      eth2 UNCHECKED
      eth3 checked
      eth3 pvid 1
      eth4 checked
      eth4 pvid 1
      eth4 vid 6,7,8
      Save
```

Disconnect your computer's Ethernet cable from eth2 / Wired Separate Network. Wait 5 to 10 seconds.  
Re-connect your computer's Ethernet cable to eth3 / Home Network. Open a new Browser window/tab and enter a URL of 192.168.3.1 and Login to the EdgeRouter

The following restores the Wired Separate Network firewall restrictions.

```
Firewall/NAT
  Firewall Policies
    WIRED_SEPARATE_LOCAL -> Actions -> Configuration
      Default Action: Drop
      Save Ruleset
```

You may want to rename the "Wifi lot" / "Wired lot" items to simply be "lot" items.

At this point, I suggest that you backup your new config.

## 84. Simple Network Management Protocol (SNMP)

To enable the ER-X to be a source of SNMP data, first press the “System” button. Reference Figure 9 – System Button. Find the SNMP Agent section, fill-in the three fields, and check Enable. Press “Save”. See Figure 172 – Sample SNMP configuration.

The ER-X appears to support both version 1 and version2(c). Version 2 supports 64 bit counters. The only security available is to change the SNMP community string to something hard to guess. Most installations assume “public”.

The screenshot shows a configuration window titled "SNMP Agent". It contains four input fields: "Enable" with a checked checkbox, "SNMP community" with the value "public", "Contact" with the value "your@email.here", and "Location" with the value "Your\_Location".

**Figure 172 – Sample SNMP configuration.**

There is a huge list of SNMP programs which could monitor your router. Some I have seen referenced are:

Snmpwalk	(Referenced in Appendix C)
Cacti	
NetworX / LibreNMS / PRTG	
Nagios / Zabbix / Dude	
OpenNMS	
MRTG	
Grafana / InfluxDB / Telegraf	(See Appendix C)

---

## 85. What devices should be placed on which Network?

Some devices could go either on the Home Network or on the IoT Network.

I'll use an Amazon Echo as the first example. The echo can execute just fine from the IoT Network. The echo typically uses a smart phone app to control it. Since Amazon's phone app doesn't have a place to enter the echo's IP address, then both the phone and the echo need to be on the same Network. If you want the echo to live on the IoT network, then you will need to temporarily connect your phone / switch your phone to the IoT network to control the echo. Note this method won't work for Wired IoT devices.

The echo could also be placed on the Home Network. Since the echo gets regular updates from Amazon, and Amazon is, presumably, smart enough to keep their device secure, I don't see having this device on the Home Network as a real problem.

Then there are devices I would NOT let on my Home Network. These are devices which don't receive firmware updates, devices which likely connect to some web service, or devices which ultimately come from Chinese manufacturers. My examples of these devices would be Baby Monitors / Security Cameras / the proverbial "Light Bulb" / etc... Who knows what is happening inside these devices' firmware? Are there hard-coded logins-passwords / open telnet ports / etc...? Hackers may be able to easily penetrate these devices, and then they are inside the Network these devices are connected to.

If you can't tell or test the security of a device, if it is not being actively updated, or if it is from some unknown manufacturer, I'd put that device on the IoT Network. To me, these types of devices are not worth the risk of having them on my Home Network, right alongside my household personal computers.

This is ultimately a convenience vs security trade off. Choose carefully. By even having an IoT network, you can now choose which Network to put your stuff onto.

This is from a discussion at <https://github.com/mjp66/Ubiquiti/issues/18>

---

## 86. Device Discovery Across Networks / Subnets

This subject is complicated. This section and the next couple of sections are all related. Your mileage will vary, as everybody has a different set of equipment, which relies on different discovery methods. The Networks involved will typically be the Home Network and one or more of the IoT Network(s).

Related Links:

<https://community.ubnt.com/t5/EdgeRouter/IOT-VLAN-multicast-still-not-working/m-p/2739880>

## 87. Multicast DNS

The use of MDNS between Networks, was suggested in <https://github.com/mjp66/Ubiquiti/issues/29> with a link of: <https://www.youtube.com/watch?v=1mjdki2pIY>

I believe MDNS allows clients to resolve host names within a subnet / Network. By adding multiple interfaces, this extends the service across multiple Networks. I don't know what security implications this extending might have.

I have tried enabling MDNS within my ER-X, didn't seem to help my particular installation.

The following interfaces may be different for you, depending upon what Networks you are trying to repeat / connect and if you choose to implement being VLAN Aware. Reference section 83. This example connects Home Net and lot Net on a VLAN Aware system.

MDNS can be enabled via the CLI or via the Config Tree. To enable via the Config Tree, open up the service -> mdns -> repeater sub-menus. Enter in your interfaces, and then click Preview. See Figure 173 – MDNS Setup Example.

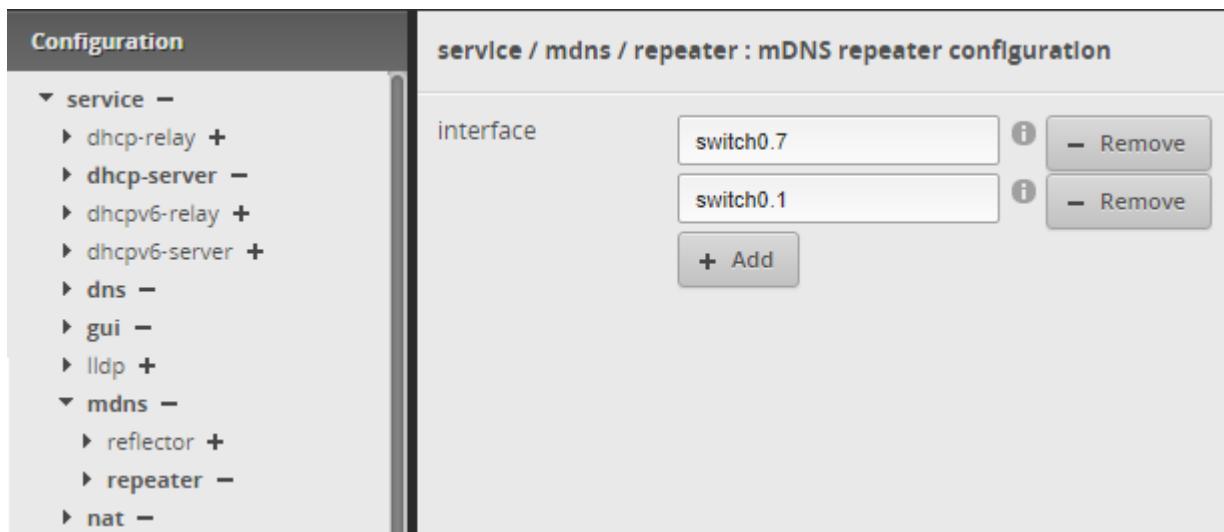

Figure 173 – MDNS Setup Example.

While trying to determine the impact of mdns, I had trouble disabling this feature via the Config Tree, so I used the following commands via the command line interface to disable this service.

```
configure
delete service mdns repeater
commit
save
exit
```

It appears that enabling Multicast DNS is also available within the UniFi (Access Point) system.

Reference the following link:

<https://community.ubnt.com/t5/UniFi-Routing-Switching/USG-and-Chromecast-across-subnets-VLANs-Multicast-or-mDNS/td-p/1782140>

## 88. Simple Service Discovery Protocol (SSDP) / igmp-proxy

SSDP is a discovery protocol used by Universal Plug and Play (UPnP.) Note that this protocol (SSDP) does not need to open holes in your WAN firewall to operate. This protocol uses UDP packets sent to a fixed IP address / port for discovering devices. I don't think this protocol was ever expected to work across two subnets i.e. two Networks.

I have been able to get the SSDP discovery packets to be transferred / copied from the Home Network to the IoT Network by using an igmp-proxy service. In order to get the SSDP replies back, I had to open up holes in the firewall from the IoT Network back into the Home Network. Not great, but what is needed if you want to discover devices on the IoT Network from a device on the Home Network. If I were opening up firewall holes, I would reserve IP address for the IoT device(s), and then only open UDP holes in the Home Out firewall for those specific device replies. Reference section 53 - HOME\_OUT Firewall Rules and section 80 - Reserving Device Addresses via DHCP.

The following interfaces may be different for you, depending upon what Network you are trying to discover from which other Network, and if you choose to implement being VLAN Aware. Reference section 79. This example allows devices on the IoT Net to be discovered from the Home Net, on a VLAN Aware system.

To enable igmp-proxy, use the CLI / putty / SSH to issue the following commands:

```
configure
set protocols igmp-proxy interface switch0.1 role upstream
set protocols igmp-proxy interface switch0.7 role downstream
set protocols igmp-proxy interface switch0.1 threshold 1
set protocols igmp-proxy interface switch0.1 alt-subnet 0.0.0.0/0
set protocols igmp-proxy interface switch0.7 threshold 1
set protocols igmp-proxy interface switch0.7 alt-subnet 0.0.0.0/0
commit ; save
```

To check the igmp-proxy, issue the following commands (you may need to wait several seconds):

```
show ip multicast mfc
show ip multicast interfaces
```

To remove the igmp-proxy services, issue the following commands

```
configure
delete protocols igmp-proxy
commit ; save
```

My ER-X's igmp-proxy seems to restart, with no problems, after a controlled shutdown / restart.

This following link may or may not be relevant:

<https://community.ubnt.com/t5/EdgeRouter/IGMP-proxy-not-starting-automatically-after-reboot/td-p/2095339>

Reference these specifications (see Discovery sections):

<http://upnp.org/specs/arch/UPnP-arch-DeviceArchitecture-v1.1.pdf>

<http://upnp.org/specs/arch/UPnP-arch-DeviceArchitecture-v2.0.pdf>

This is a weird protocol. The device doing the discovery sends out a UDP packet, somewhat formatted as HTTP-data, to a non-existing IP address of 239.255.255.250 with a destination port of 1900. SSDP listeners (somehow) receive this packet even though they are actually on a different (for us: 192.168.X.X) Network and (should) respond back to the sender's real (originating) IP address / port number with their "discoverable" information.

Now this gets even weirder. I have a Roku device on my lot Network. It responded back TWICE, saying it was from address / port:

192.168.7.95 / 60000 (Correct)

and from

192.168.49.1 / 60000 (Incorrect)

The contents of the reply packets from the Roku both contained the correct IP address / port of the Roku:

"LOCATION: http://192.168.7.95:60000/upnp/dev/...".

for the discoverer to be able to contact the Roku device. The second packet (which was addressed to 192.168.49.1) broke through my original Home Out firewall rules. Reference updated rules within section 53 - HOME\_OUT Firewall Rules. This is why I have switched over to using the full set of RFC-1918 addresses.

Here are some related links:

<https://help.ubnt.com/hc/en-us/articles/360001004034-UniFi-Best-Practices-for-Managing-Chromecast-Google-Home-on-UniFi-Network>

<https://help.ubnt.com/hc/en-us/articles/204961854-EdgeRouter-Set-up-IGMP-proxy-and-statistics>

<https://community.ubnt.com/t5/UniFi-Routing-Switching/Configure-Sonos-across-subnets-on-USG/td-p/1979899>

Here is a command to see what is going through the firewall on port 1900:

```
sudo tcpdump -i switch0.1 port 1900 -vv
```

---

## 89. socat - Multipurpose relay (SOcket CAT)

I have not tried this, but this is another tool for discovery across Networks / subnets.

Reference links:

<http://www.dest-unreach.org/socat/>

<https://linux.die.net/man/1/socat>

Ubiquiti Links:

<https://community.ubnt.com/t5/EdgeRouter/Howto-HDHomerun-discovery-on-different-LAN-segment/m-p/2750080>

<http://www.cron.dk/edgerouter-and-chromecast/>

---

## 90. Insecurity versus Convenience

Otherwise known as “Punching holes in your firewall”.

This example will involve allowing an SSDP reply from a specific IOT device to reach a specific HomeNet device.

Reference section 53 - HOME\_OUT Firewall Rules. The HOME\_OUT firewall has a bunch of Allow “Established / Related” rules, with one for each Network, followed by a drop of RFC-1918 addresses.

Reference section 88 - Simple Service Discovery Protocol (SSDP) / igmp-proxy. In SSDP, the querying equipment opens a (high) UDP port, sends out a UDP query to a destination port of 1900, and listens / receives replies which are sent back to the original (high) UDP port. The SSDP query data contains the originators IP address and the originators (high) UDP port number, so the responders know where to respond. This (high) port number may-not-be / is-probably-not at a fixed port number.

For the following rule to work, ensure that both devices have had their IP addresses reserved. Reference section 80 - Reserving Device Addresses via DHCP.

The following rule (inserted in HOME\_OUT) would allow the 192.168.7.154 IOT device to reply back to the 192.168.3.81 HomeNet device with any UDP data to any UDP port:

```
rule 40 {  
    action accept  
    description "Allow Example IOT Reply"  
    destination {  
        address 192.168.3.81  
    }  
    log disable  
    protocol udp  
    source {  
        address 192.168.7.154  
    }  
}
```

## 92. UNMS - Ubiquiti Network Management System

Barely played with this:

<https://help.ubnt.com/hc/en-us/sections/115003321288-UNMS-Ubiquiti-Network-Management-System>

<https://help.ubnt.com/hc/en-us/articles/360008732414-UNMS-NetFlow>

---

## 93. Intrusion Detection Systems

**QUESTION:** Which one to pick? How to configure it / connect it to the EdgeRouter?

@BuckeyeNet suggests Security Onion. Security Onion is at <https://securityonion.net/> and <https://github.com/security-onion-solutions/security-onion/wiki/IntroductionToSecurityOnion>

Seems to be rather involved. I have not tried Security Onion yet.

---

## 95. Conclusions

I hope that this guide helped you set up your Ubiquiti equipment, and that you have learned a lot.

Enjoy your new network.

-Mike

## Appendix A. TP-Link TL-SG105EV2 Switch Setup

This section has nothing to do with the ER-X setup. This section is related to Method 1 of section 11, for using multiple UAPs.

[Note I also tried a TP-Link TL-SG105 (Ver 2.1) UN-managed Gigabit switch, and it also worked. I am amazed. Maybe Gigabit switch chips are now designed to pass (the larger) VLAN frame data automatically, I don't know. This makes the rest of this section pretty much academic.]

The inexpensive Netgear switches should also work, I just happened to have Tp-Link models available for use. I believe these switches will need a hardware version of V2 or above to operate correctly. These directions are approximate.

I configured an additional AP-AC-LR Ubiquiti Access Point by referencing the “General” portion of section 11, and then following sections 66 through 71 for this additional UAP.

I connected the Tp-Link switch to my computer, with the computer configured with a fixed address of 192.168.1.10. Reference section 8 for how to configure a computer’s Ethernet port. Using the Tp-Link software, I then configured this switch to have a specific 192.168.3.X address. After saving the configuration, I re-configured my computer back to DHCP, and re-connected the computer to the Home Network. I also connected the new switch to the Home Network. I then made a static reservation within the ER-X for this switch.

For this example, I will use and connect two UAPs to this switch. I choose port 4 and port 5 for those UAP connections. I also choose port 1 of this switch to connect to the ER-X’s eth4 port.

Using the Tp-Link software, I selected the VLAN / 802.1Q VLAN page. See Figure 174 – Tp-Link Initial 802.1Q Dialog.

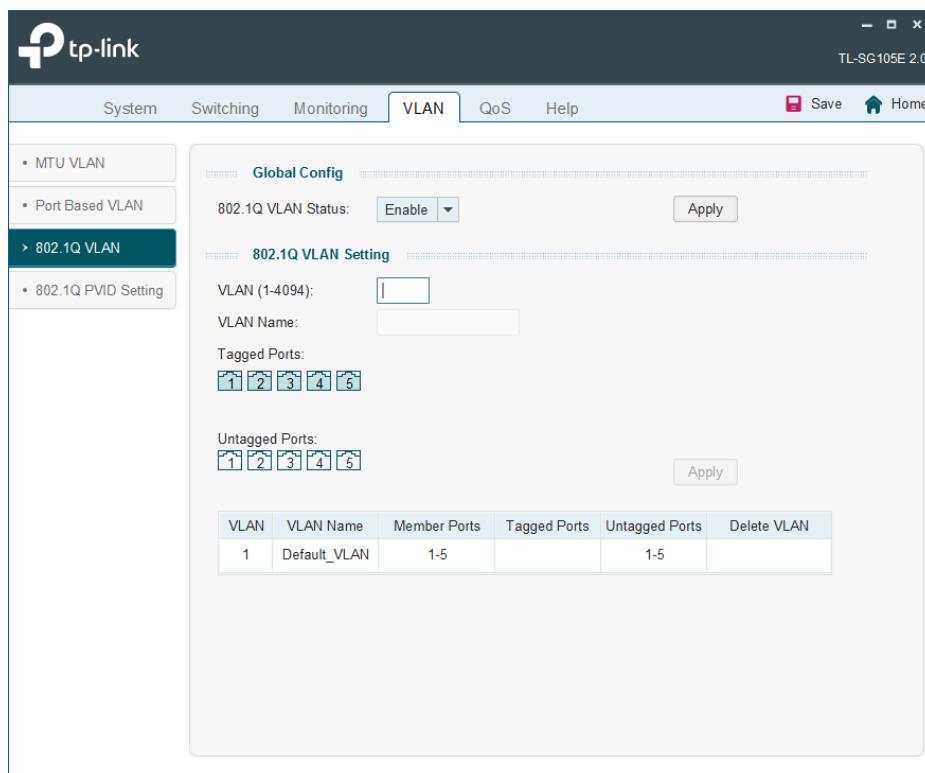

Figure 174 – Tp-Link Initial 802.1Q Dialog.

On the VLAN page, enable the Global Config.

Reference Table 1 - Table of Networks for the VLAN Networks used for this project. Enter the following information into the VLAN Page:

VLAN: 6

VLAN Name: WiFiGuest

Tag the ports: 1, 4, 5

See Figure 175 – Tp-Link VLAN 6 Configuration.

Press Apply

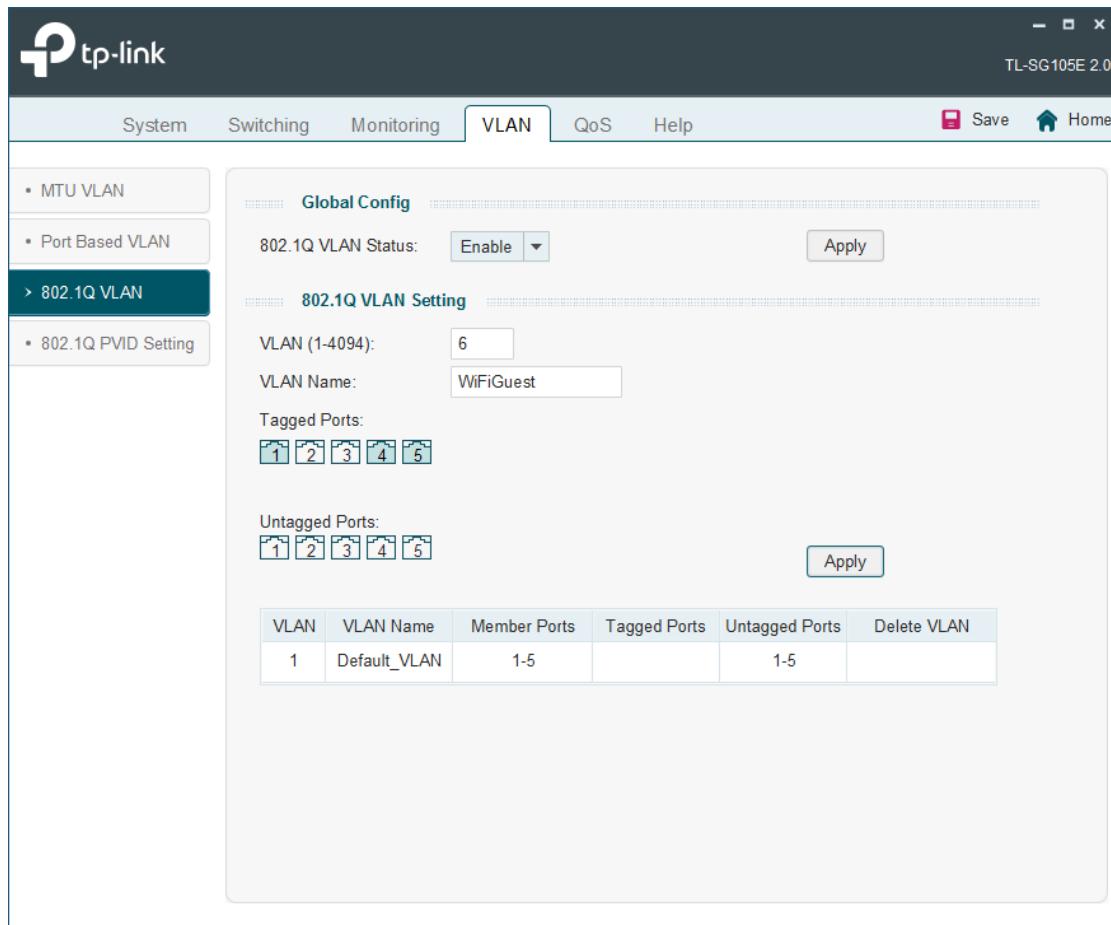

Figure 175 – Tp-Link VLAN 6 Configuration.

Enter the following information into the VLAN Page:

VLAN: 7

VLAN Name: WiFilot

Tag the ports: 1, 4, 5

See Figure 176 – Tp-Link VLAN 7 Configuration.

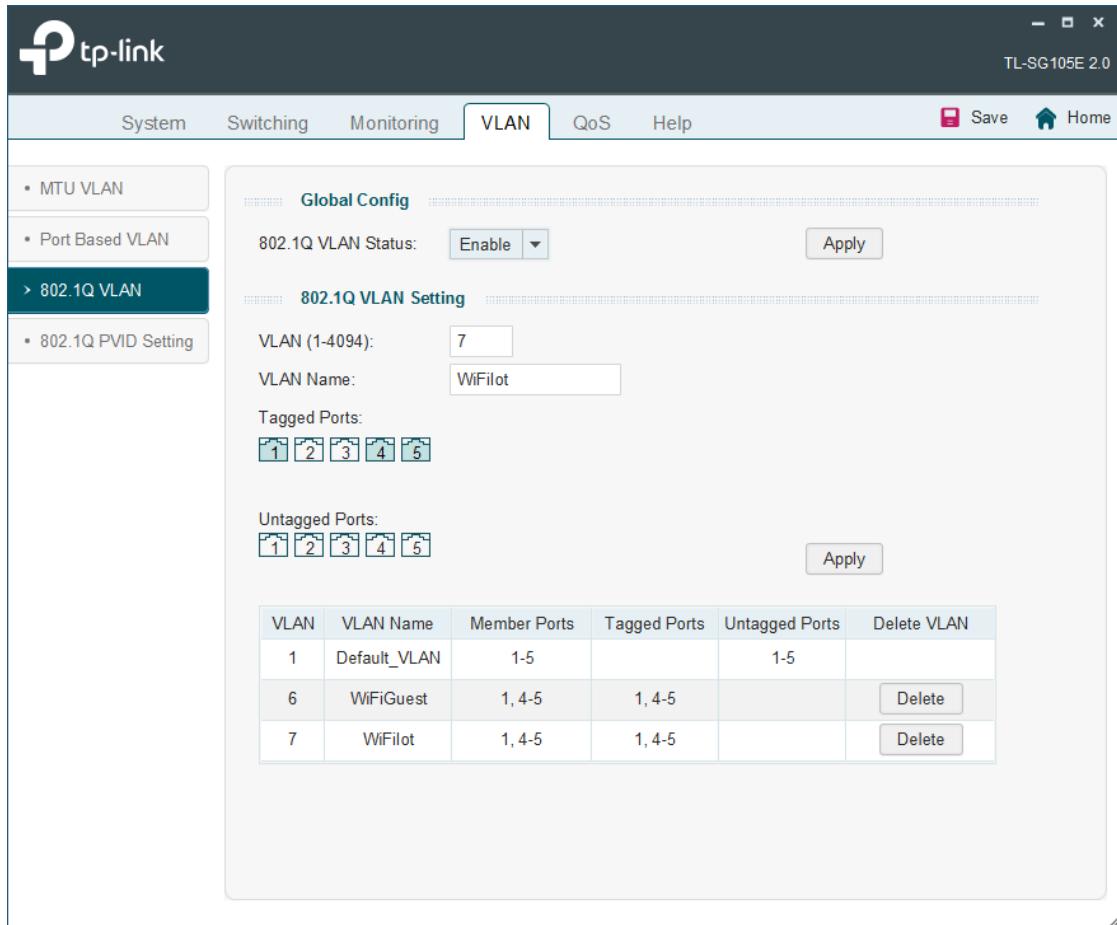

Press Apply.

The screenshot shows the TP-Link TL-SG105E 2.0 web interface. The top navigation bar includes System, Switching, Monitoring, VLAN (selected), QoS, and Help, along with Save and Home buttons. The left sidebar has options for MTU VLAN, Port Based VLAN, 802.1Q VLAN (selected), and 802.1Q PVID Setting. The main content area is titled 'Global Config' and shows '802.1Q VLAN Status' set to 'Enable'. Below this is the '802.1Q VLAN Setting' section where 'VLAN (1-4094)' is set to 7, 'VLAN Name' is set to WiFilot, and 'Tagged Ports' are selected as 1, 2, 3, 4, and 5. Under 'Untagged Ports', ports 1, 2, 3, 4, and 5 are listed. An 'Apply' button is present. A table at the bottom lists existing VLANs: VLAN 1 is Default\_VLAN with member ports 1-5; VLAN 6 is WiFiGuest with member ports 1, 4-5. An 'Delete' button is available for VLAN 6.

VLAN	VLAN Name	Member Ports	Tagged Ports	Untagged Ports	Delete VLAN
1	Default_VLAN	1-5		1-5	
6	WiFiGuest	1, 4-5	1, 4-5		Delete

Figure 176 – Tp-Link VLAN 7 Configuration.

When you are finished, your screen should look like Figure 177 – Tp-Link VLAN Final Configuration.

**Figure 177 – Tp-Link VLAN Final Configuration.**

If you wish to use the “Spare” SSID, enter the following information into the VLAN Page:

VLAN: 8

VLAN Name: WiFiSpare

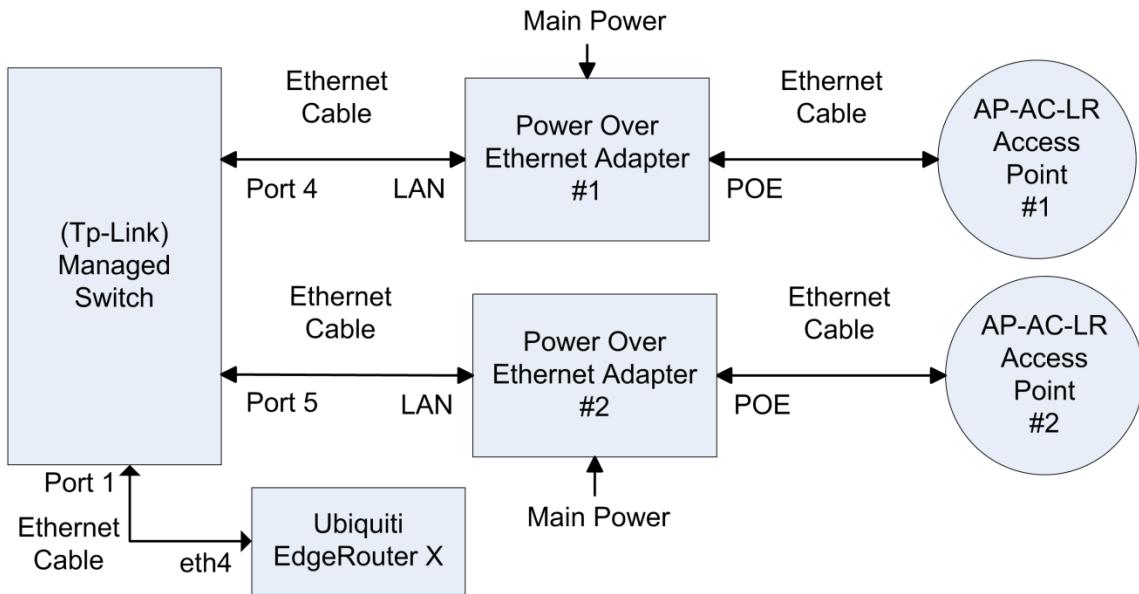

Tag the ports: 1, 4, 5

There is no screenshot for this entry.

Press Save in the upper right.

After this configuration, I disconnected this switch from the Home Network. I disconnected the original UAP from the ER-X eth4 port.

I then connected port 1 of the Tp-Link switch to the ER-X's eth4 port. I connected one UAP (via its Power Over Ethernet (POE) adapter) to the Tp-Link switch port 4 and the other UAP, via its POE, to the Tp-Link switch port 5. See Figure 178 – Multiple Access Point Wiring. Also reference section 65 and Figure 110 – Typical Access Point Wiring. I did nothing with the Tp-Link switch ports 2 and 3.

**Figure 178 – Multiple Access Point Wiring.**

For testing purposes, I configured each of my two UAPs with differently-named-sets of SSIDs. This way I could control and test which UAP I was actually connecting to.

---

## Appendix B. Multimedia over Coax Alliance (MOCA)

This section has nothing to do with the ER-X setup; this is just general networking information.

If your house is wired for television coax i.e. "Cable TV" and you do not have satellite TV, you might be able to use Multimedia over Coax Alliance (MOCA) adapters as an alternative to direct Ethernet cabling. This could be useful if you want to place your UAP in the center of your house, and don't have / can't wire direct Ethernet cabling to that location from your router. These could also be used to position a second UAP at that far end of a house, where you can't run any Ethernet wires.

A MOCA adapter will re-broadcast Ethernet traffic over Cable TV wires to another MOCA adapter. You need at least two MOCA adapters to network together. These adapters can concurrently operate over coax wires which are carrying Cable TV signals. If you use these adapters, you will also want to install a Point of Entry (POE) filter, so that your MOCA signals don't contaminate the Cable TV provider's network, i.e. your neighborhood.

A friend of mine had trouble streaming WiFi data to his television set, which was at the far end of his house from his router. He purchased two MOCA adapters to Ethernet connect his Television to his router. He has had no problems and has since purchased two more adapters to provide more Ethernet drops in his house.

You will want at least version 2.0 adapters. You will need MOCA adapters which support 802.1Q if you will be using them to connect UAPs to your ER-X. A pair of these adapters seems to be about U.S. \$170. That's pretty expensive, but might be worth it, if your only other alternative is (typically unreliable) Power-line Ethernet adapters.

---

## Appendix C. Monitoring an EdgeRouter via SNMP with Grafana running on a Raspberry Pi

This section has nothing to do with the ER-X setup.

=====

### Appendix C - Part 1

The following directions will show how to install and configure Grafana, InfluxDB, and Telegraf on a Raspberry Pi, for monitoring EdgeRouter statistics. Preview pictures are available in one of the below links.

The heavy lifting on this project was done by @waterside. Here are the major references:

<https://github.com/WaterByWind/grafana-dashboards>

<https://github.com/WaterByWind/grafana-dashboards/tree/master/UBNT-EdgeRouter>

<https://grafana.com/dashboards/1756> (with pictures)

<https://community.ubnt.com/t5/UniFi-Wireless/Grafana-dashboard-for-UniFi-APs-now-available/td-p/1833532>

Most of the following items will be performed in a command terminal, so you will need to be generally familiar with RaspberryPi / Linux / Rasbian to continue. You will need to enable SNMP on the ER-X, Reference section 84 - Simple Network Management Protocol (SNMP).

To enable the Grafana web page to be remotely accessed by computers other than the Pi (i.e. accessed via PCs on the HomeNetwork), the Pi running these tools will need to be assigned a reserved IP address. Reference section 80 - Reserving Device Addresses via DHCP, for how to do this. Since the Pi is relatively slow, I suggest not browsing directly on the Pi, after the initial setup.

Start with Rasbian Stretch. I used a 32Gig micro SD card, as I expect to collect a lot of data over time.

#### Configure Pi

Menu -> Preferences -> Raspberry Pi Configuration

##### Localization Tab

Set Locale

Set Timezone

Set Keyboard

Set WiFi Country

(You may also want to enable the following)

##### Interfaces Tab

SSH: Enable

VNC: Enable

#### Update PI Operating System

```
sudo apt-get update  
sudo apt-get upgrade
```

#### Install SNMP and associated tools

```
sudo apt-get install snmp  
sudo apt-get install snmpd  
sudo apt-get install dnsutils
```

Test ER-X's SNMP setup by issuing:

```
snmpwalk -v2c -c public 192.168.3.1
```

You should see a lot of data, most of it starting with "iso".

Download binaries

Go to <https://www.influxdata.com/>

(The depiction below is what I saw and the commands which I copied from the website and then ran.)

(You will want to check for and use updated instructions / versions / commands.)

(The wget commands are one long line, which is wrapped within this document.)

Select Download tab

Select Telegraf (v1.5.2) button

Find Linux Binaries (ARM) section

```
wget https://dl.influxdata.com/telegraf/releases/telegraf-  
1.5.2_linux_armhf.tar.gz  
tar xvfz telegraf-1.5.2_linux_armhf.tar.gz
```

Select InfluxDB (v1.4.3) button

Find Linux Binaries (ARM) section

```
wget https://dl.influxdata.com/influxdb/releases/influxdb-  
1.4.3_linux_armhf.tar.gz  
tar xvfz influxdb-1.4.3_linux_armhf.tar.gz
```

Select Chronograf (v1.4.2.1) button

Find Linux Binaries (ARM) section

```
wget https://dl.influxdata.com/chronograf/releases/chronograf-  
1.4.2.1_linux_armhf.tar.gz  
tar xvfz chronograf-1.4.2.1_linux_armhf.tar.gz
```

Install (copy) binaries per

<https://community.influxdata.com/t/installing-on-a-raspberry-pi/2159>

(You will want to adjust directory names for your specific versions.)

```
cd telegraf  
sudo cp -rp usr/* /usr  
sudo cp -rp etc/* /etc  
sudo cp -rp var/* /var  
cd ..  
  
cd influxdb-1.4.3-1  
sudo cp -rp usr/* /usr  
sudo cp -rp etc/* /etc  
sudo cp -rp var/* /var  
cd ..  
  
cd cronograf-1.4.2.1-1  
sudo cp -rp usr/* /usr  
sudo cp -rp etc/* /etc  
sudo cp -rp var/* /var  
cd ..
```

Put the following text into:

```
/etc/systemd/system/influxdb.service  
[Unit]  
Description=InfluxDB service  
After=network.target  
[Service]  
ExecStart=/usr/bin/influxd  
Restart=always  
[Install]  
WantedBy=multi-user.target
```

Start the service (now) with the following command:

```
sudo systemctl start influxdb.service
```

Check that the service is running with:

```
systemctl | grep influx
```

Auto start the service (after re-boots) with the following command:

```
sudo systemctl enable influxdb.service
```

Put the following text into:

```
/etc/systemd/system/telegraf.service
```

```
[Unit]  
Description=Telegraf service  
After=network.target  
[Service]  
ExecStart=/usr/bin/telegraf -config /etc/telegraf/telegraf.conf  
Restart=always  
[Install]  
WantedBy=multi-user.target
```

Note that the ExecStart is really one long line, upto the Restart line. It may be wrapped within this document.

Start the service (now) with the following command:

```
sudo systemctl start telegraf.service
```

Check that the service is running with:

```
systemctl | grep telegraf
```

Auto start the service (after re-boots) with the following command:

```
sudo systemctl enable telegraf.service
```

Download and install grafana

Go to <https://github.com/f2it/grafana-on-raspberry>

(You will want to check for and use updated instructions / versions / commands.)

(Some instructions / commands will be presented, after you issue the dpkg command.)

Press the raspberry pi 2 and 3 (armv7) Download button in the middle of screen

Save file grafana\_5.0.0\_armhf.deb whose link is near the bottom of the page

Issue the following command:

```
sudo dpkg -i Downloads/grafana_5.0.0_armhf.deb
```

Follow presented instructions, which for my version, included:

```
sudo /bin/systemctl daemon-reload  
sudo /bin/systemctl enable grafana-server  
sudo /bin/systemctl start grafana-server
```

Acquire needed mib files, by issuing the following command:

```
sudo apt-get install snmp-mibs-downloader
```

Download zip from:

<https://github.com/WaterByWind/grafana-dashboards>

(Use the green “Clone or download” button, then “Download ZIP” button)

Unzip the file:

```
unzip Downloads/grafana-dashboards-master.zip
```

Configure telegraf

```
cd /etc/telegraf  
cp telegraf.conf telegraf.conf.orig
```

Edit telegraf.conf

```
Change the line:      interval = "10s"  
To:                  interval = "60s"  
Change the line:      collection_jitter = "0s"  
To:                  collection_jitter = "10s"  
Change the line:      # username = "telegraf"  
To:                  username = "username"  
Change the line:      # password = "metricsmetricsmetricsmetrics"  
To:                  password = "password"  
Uncomment:           # user_agent = "telegraf"  
Append the contents of grafana-dashboards-master/UBNT-EdgeRouter/telegraf-inputs.conf  
to telegraf.conf. You may want to add separator comment line(s) between the sections.  
Change the line:      agents = [ "edgerouter1", "edgerouter2" ]  
To:                  agents = [ "192.168.3.1" ]
```

```
sudo systemctl restart telegraf.service
```

```
cd /home/pi
```

Check that the service is running with:

```
systemctl | grep telegraf
```

Test telegraf (this is one long command line)

```
telegraf --config /etc/telegraf/telegraf.conf --config-directory  
/etc/telegraf/telegraf.d --input-filter snmp --test
```

You should see a huge block of data, with no error messages.

Only if you see error messages, will you need to acquire additional mib files from your ER-X's /usr/share/mibs directory.

(I used WinSCP, which allows files to be copied to/from a Windows PC against another system.)

(You may instead be able to acquire the mib files by other means or over the internet.)

(See also <https://github.com/WaterByWind/grafana-dashboards/issues/3>)

(See also <https://github.com/WaterByWind/grafana-dashboards/issues/1>)

```
mkdir /usr/share/mibs/  
mkdir /usr/share/mibs/site  
chmod ugo+w /usr/share/mibs/site  
cp <mib_files> /usr/share/mibs/site  
cd /home/pi
```

Locally login to grafana, by browsing to <http://localhost:3000>

admin

admin

Login button

Reference: <https://github.com/WaterByWind/grafana-dashboards/tree/master/Extra>

(To enable the Grafana web page to be remotely accessed by computers other than the Pi

(i.e. accessed via PCs on the HomeNetwork), substitute the Pi's IP address for the above "localhost".)

Choose Add data source

Enter the following information:

Name	Telegraf
Type	InfluxDB
URL	<a href="http://localhost:8086">http://localhost:8086</a>
Access	direct
Database	telegraf
User	username
Password	password
Press the	Save&Test button

Add a dashboard

1. Hover over the upper-left + button
2. Choose Import from the Create section
3. Enter 1756 into the Grafana.com Dashboard box
4. Press the Load Button
5. Under "Options Name", Enter: UBNT EdgeRouter Dashboard
6. Under "Options Telegraf", Select: Telegraf
7. Press the Import button

The new dashboard should then be selected for you

Under Choose Router, select: 192.168.3.1

If the dashboard is not selected, hover over the "4 squares" upper-left icon, and then select Dashboard <dashboard name>.

You should now be viewing your ER-X's SNMP data graphs.

You can change the time scale of the graphs by clicking on the upper-right clock icon.

=====

## Appendix C - Part 2

At some point, I was having occasional network problems and suspected dns as the root problem. Here are some additions to the above grafana setup.

This portion will graph pinging times to web servers, which will test internet access.

Per <https://grafana.com/dashboards/2690>

Append the following to your telegraf.conf:

(You may want to add separator comment line(s) between the sections.)

```
[ [inputs.ping]]
  interval = "60s"
  urls = [ "amazon.com", "github.com", "google.com" ]
  count = 4
  ping_interval = 1.0
  timeout = 2.0
```

Restart telegraf

```
sudo systemctl restart telegraf.service
```

Test new telegraf entry (this is one long command line)

```
telegraf --config /etc/telegraf/telegraf.conf --config-directory
/etc/telegraf/telegraf.d --input-filter ping --test
```

After a few seconds, you should see 3 "> ping" lines.

Add a dashboard

1. Hover over the upper-left + button
2. Choose Import from the Create section
3. Enter 2690 into the Grafana.com Dashboard box
4. Press the Load Button
5. Under “Options Name”, Enter: Ping Monitor
6. Under “Options Telegraf”, Select: Telegraf
7. Press the Import button

As written, this dashboard seems to have trouble displaying the data sometimes.

The following edits seem to help:

1. Select the Ping Monitor dashboard.
2. Hover over the “Ping Average Response Time” title, and then click on the down caret which appears.
3. Choose Edit
4. Ensure you have the Metrics Tab selected (in the middle of the screen)
5. Go to the line

```
GROUP BY time($_interval) tag(url) fill(null)
```

and click on the word ‘null’, select ‘none’ from the list, as in:

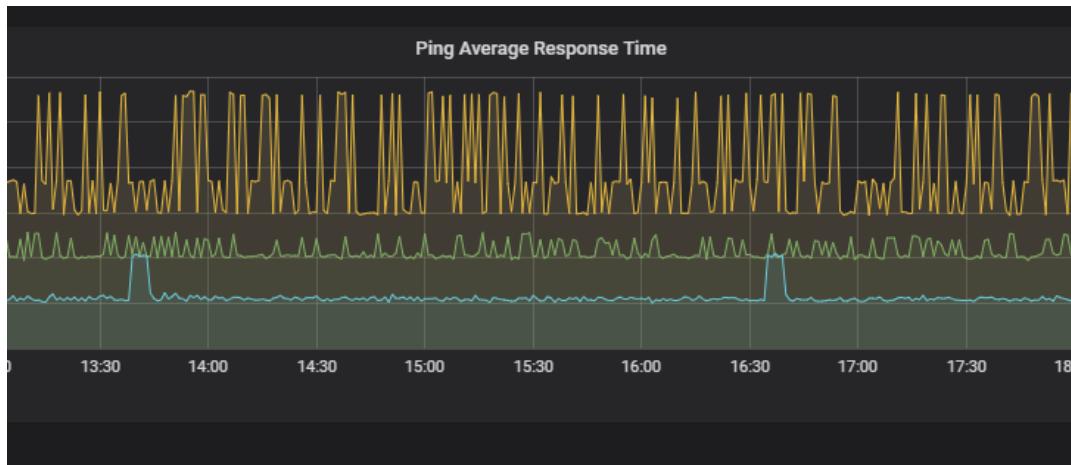

```
GROUP BY time($_interval) tag(url) fill(null)
```

Click on the X, which is to the right of all of the graph tabs, to exit editing.

Press the Save Dashboard button, which looks like a floppy icon, at the top of screen.

Perform the same change as above i.e. “fill(null)” -> fill(“none”), for the “Packet Loss Percentage” graph.

You should start collecting data. A portion of the screen should eventually look like Figure 179 – Example Grafana Ping Monitor Portion.

**Figure 179 – Example Grafana Ping Monitor Portion**

=====

## Appendix C - Part 3

This portion will graph dns queries made to multiple dns resolvers.

Per [https://github.com/influxdata/telegraf/tree/master/plugins/inputs/dns\\_query](https://github.com/influxdata/telegraf/tree/master/plugins/inputs/dns_query)

Append the following to your telegraf.conf:

(You may want to add separator comment line(s) between the sections.)

```
# Dns Query Config:  
[[inputs.dns_query]]  
## servers to query  
servers = [ "192.168.3.1", "209.244.0.3", "8.8.8.8", "9.9.9.9" ]  
## Network is the network protocol name.  
network = "udp"  
## Domains or subdomains to query.  
domains = [ "amazon.com", "github.com", "google.com" ]  
## Query record type.  
## Possible values: A, AAAA, CNAME, MX, NS, PTR, TXT, SOA, SPF, SRV.  
record_type = "A"  
## Dns server port.  
port = 53  
## Query timeout in seconds.  
timeout = 2
```

Restart telegraf

```
sudo systemctl restart telegraf.service
```

Test new entry (this is one long command line)

```
telegraf --config /etc/telegraf/telegraf.conf --config-directory  
/etc/telegraf/telegraf.d --input-filter dns_query --test
```

You should see 12 "> dns\_query" lines.

Create a new Dashboard

1. Hover over / click on the “4 squares” upper-left icon, then select Dashboards / Home.

2. Hover over the upper-left + button, choose Create Dashboard

3. Choose Graph

4. Hover over the “Panel Title” title, and then click on the down caret which appears.

5. Choose Edit

6. Select General Tab under Graph

7. In the Title box, enter: ER-X Dns

8. Select Metrics Tab under Graph

9. Under Data Source, select: Telegraf

10: You should see a line which looks like:

“FROM default select measurement WHERE +”

Click on “select measurement” and choose “dns\_query”

Click on the + sign and select “server”

Click on “select tag value” and select “192.168.3.1”, leave the “=” sign alone.

The line should now look like: “FROM default dns\_query WHERE server = 192.168.3.1”

11. You should see a line which looks like:

“SELECT field(value) mean() +”

Click on “value” and select “query\_time\_ms”

Click on “mean()” and select Remove, click on the new + sign and choose max() under Selectors.

The line should now look like: “SELECT field(query\_time\_ms) max()”

12. You should see a line which looks like:

GROUP BY time(\$\_interval) fill(null) +

Click on the + sign, and select “tag(domain)”.

Select “null” and change into “none”

The line should now look like: “GROUP BY time(\$\_interval) tag(domain) fill(null)”

13. Leave the “FORMAT AS Time series line alone.

14. In the ALIAS BY box, enter: \$tag\_domain

15. Select the Graph Axes Tab.

Under the Left Y group change the following:

Y-Min auto to 0

Y-Max auto to 100

16 Click on the X, which is to the right of all of the graph tabs, to exit editing.

17. Press the Save Dashboard button, which looks like a floppy icon, at the top of screen.

DNS data should start accumulating. We need a total of four panels, so we will duplicate this panel three times, slightly editing each one.

#### Duplicate Panel

1. Hover over the “ER-X Dns” title, and then click on the down caret which appears.
2. Select More, then select Duplicate.

#### Modify New Panel

1. Hover over the NEW “ER-X Dns” title, and then click on the down caret which appears.
2. Select Edit.
3. Select General Tab under Graph
4. In the Title box, change: ER-X Dns to Level3 Dns
5. Select Graph Metrics Tab under Graph
6. In the FROM line, select 192.168.3.1 and then select (change to) 209.244.0.3
7. Click on the X, which is to the right of all of the graph tabs, to exit editing.
8. Press the Save Dashboard button, which looks like a floppy icon, at the top of screen.

Repeat the above “Duplicate Panel” and “Modify New Panel” steps with the following data:

Title Google Dns

server equals 8.8.8.8

Repeat the above “Duplicate Panel” and “Modify New Panel” steps with the following data:

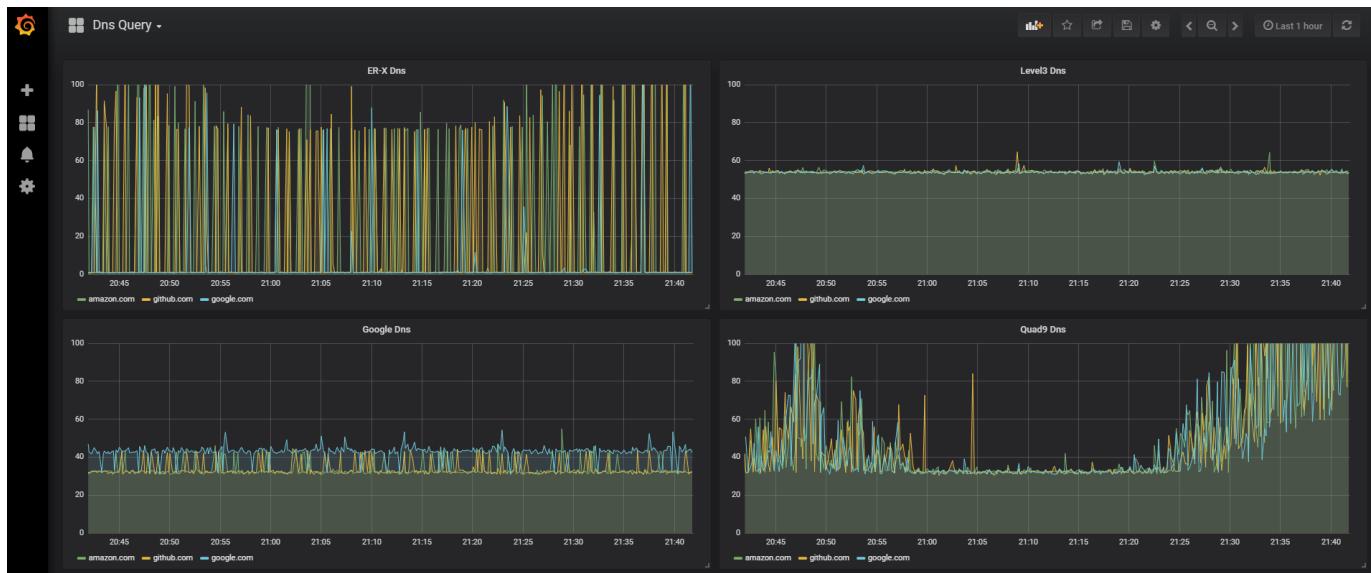

Title Quad9 Dns

server equals 9.9.9.9

My graphs eventually looked like Figure 180 – Example Grafana DNS Queries.

How interesting!

I believe that I will need to investigate and adjust dnsmasq settings in the 81 - Adblocking and Blacklisting section. What I have seems to work, but is definitely non-optimal.

## Appendix C - Part 4

This portion may someday graph UniFi Access Point information, per the URLs given in Part 1.
